

# Complex Analysis

# After Logarithm Notes

## Logarithm of general functions

$X$  is a metric space :-

Let  $X \xrightarrow{f} \mathbb{C}/\{0\}$ . Then we say:

$g : X \rightarrow \mathbb{C}$  is a log of  $f$  if  $\forall x \in X, f(x) = e^{g(x)}$

$g(x)$  is continuous log if  $f$  and  $g$  are continuous

### Special Case

If  $X \subseteq \mathbb{C}$ ,  $f$  is holomorphic open

If  $g$  is wlo  $\Rightarrow g$  is holomorphic log of  $f$ .

e.g.:  $X = \mathbb{C} \setminus \overline{R_\alpha}$ .  $f(z) = z \Rightarrow g(z) = \log_\alpha z$   
 $g(z)$  is wlo log of  $f$ .

we assume  $f(x)$  is continuous throughout

## Continuous Argument

\*  $\theta: X \rightarrow \mathbb{R}$ , cont<sup>n</sup> arg of  $f$

if

$$\forall x \in X, f(x) = |f(x)| e^{i\theta(x)}$$

$\theta$  = continuous function

### Theorem:

$$\begin{array}{ccc} \text{continuous} & \iff & \text{continuous} \\ \text{Argument} & & \text{logarithm} \end{array}$$

Proof:-

$$g(x) = u(x) + i v(x)$$

$$f = e^g = e^u \cdot e^{iv}$$

$$|f| = e^u = |f(x)| \quad \left| \begin{array}{l} \text{define } g = \log |f(x)| \\ \qquad \qquad \qquad + i v(x) \end{array} \right.$$

$$u = \log |f| \quad \quad \quad$$

i.e.  $f(x) = |f(x)| \cdot e^{i \operatorname{Im}(g(x))}$

$$f(x) = |f(x)| \cdot e$$

i.e. if  $v(x)$  is continuous,  
 $g$  is continuous

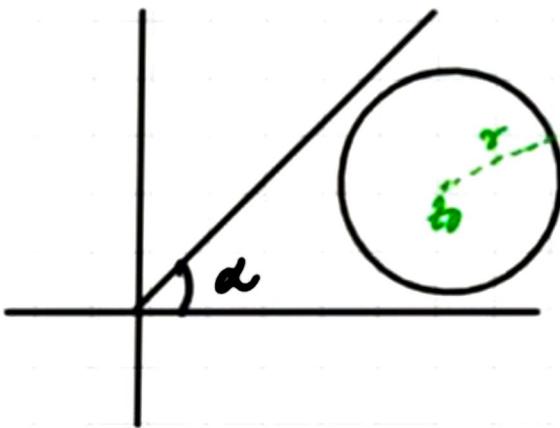

$$\text{Hly} \iff f(x) = e^{\log |f(x)|} \cdot e^{i\theta(x)}$$

$$f(x) = e^{\log |f(x)|} \cdot e^{i\theta(x)}$$

Assumption:  $\log |f(x)|$  is contn. ✓✓

★ if a holo  $f^n$  has a cont<sup>n</sup> log, then  
is the log holo?

Ans:  $f: U \xrightarrow{\text{holo}} \mathbb{C}$ , assume  $\exists \alpha \in \mathbb{R}$   
 $\ni f(U) \cap \overline{R_\alpha} = \emptyset$   
 $\Rightarrow \log_\alpha f$  is holomorphic

we can always get a  
ray avoiding  $D(z_0, r)$   
if  $0 \notin D(z_0, r)$

Then,

$$\exists \alpha \in \mathbb{R} \ni \overline{R_\alpha} \cap D(z_0; r) = \emptyset$$

$$\therefore \nexists f: U \xrightarrow{\text{holo}} D(z_0; r),$$

$\exists$  a holomorphic function.

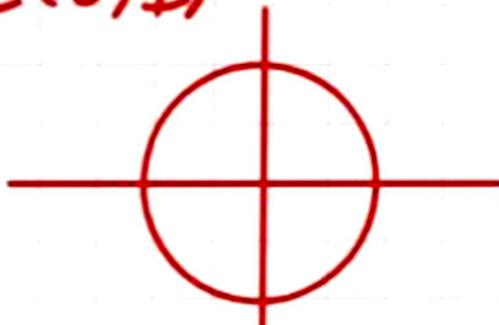

$$f(t) = \frac{\theta(e^{it}) + \theta(e^{-it})}{2\pi}$$

is a choice for  $A(1)$   
hence,  $f(t)$  is constant

$$f(z) = c.$$

more it doesn't have  
a continuous argument

$c(0; 1)$

## Uniqueness of log

$$e^{g(x)} = e^{g_1(x)}$$

$$g(x) = u + iv \quad g_1 = u_1 + iv_1$$

$$\star u = u_1 = \log |f|$$

$$\text{and } v(x) - v_1(x) \in 2\pi\mathbb{Z}$$

Also,

Assume  $f, g, g_1$  are continuous &  $X$  is **Connected**

then,  $v - v_1$  is a constant

because  $g - g_1$  is  
continuous  $\Rightarrow g - g_1 = 2\pi i k$  is cont<sup>n</sup>  
function  $i.e. k$  is constant  $(k \in \mathbb{Z})$

Lemma:  $\gamma: [a,b] \xrightarrow{\text{cont}^n} \mathbb{C} \setminus \{0\}$

I Then  $\gamma$  has a cont<sup>n</sup> arg.

We'll prove general version:-

II  $f: [a,b] \times [c,d] \xrightarrow{\text{cont}^n} \mathbb{C} \setminus \{0\}$

$\star \alpha := \arg - \theta = m\pi - n\pi$   
on  $S'$  because if  $\theta(z_1) = \theta(z_2)$   
then  $z_1 = z_2 \Rightarrow \theta(z) - \theta(-z) = 0$   
check:  $f = \frac{\theta(z) - \theta(-z)}{|\theta(z) - \theta(-z)|}$   
See,  $f(-z) = -f(z)$

Claim II  $\Rightarrow$  I  
then  $f$  has a cont<sup>n</sup> arg

**Proof**  $\tilde{\gamma}: [a, b] \times [0, 1] \rightarrow \mathbb{C} \setminus \{0\}$

$$\tilde{\gamma}(t, s) \longrightarrow \gamma(t)$$

$\Rightarrow \tilde{\gamma}$  is continuous ( $\gamma$  is continuous)

Also,  $\tilde{\gamma}(t, s) = |\tilde{\gamma}(t, s)| e^{i\theta(t, s)}$

$\tilde{\gamma}$  is cont<sup>n</sup>  $\Rightarrow \tilde{\theta}(t, s)$  is cont<sup>n</sup>

Put  $s=0$  {Assumption}

$$\gamma(t) = |\gamma(t)| e^{i\theta(t)}$$

while  $\theta(t) = \tilde{\theta}(t, 0)$  continuous

$$|\gamma(t)| = |\tilde{\gamma}(t, 0)|$$

Hence,  $\theta(t)$  is continuous  $\Rightarrow \gamma$  has a continuous argument

①  $(\theta(b) - \theta(a))/2\pi$  doesn't depend on  $\tilde{\theta}$  &  $\gamma$  is closed & cont<sup>n</sup>

Let  $\theta$  be acts arg and  $\gamma$  is closed

i.e.  $\gamma(a) = \gamma(b)$

$$\text{i.e. } \gamma(a) = \underbrace{|\gamma(a)| e^{i\theta(a)}}_{= 1} = \underbrace{|\gamma(b)| e^{i\theta(b)}}_{= 1}$$

$$\text{i.e } \frac{\theta(b) - \theta(a)}{2\pi} \in \mathbb{Z}$$

$\exists k_{00}, \exists$

Let  $\theta_1$  be another cont<sup>n</sup> arg,  $\theta_1 = \theta + 2\pi k_{00}$ ,

$$\Rightarrow \theta_1 \frac{\theta_1(b) - \theta_1(a)}{2\pi} = \frac{\theta(b) - \theta(a)}{2\pi}$$

i.e It doesn't depend on choice of

$$\textcircled{3} \quad \gamma: [a, b] \xrightarrow[\text{closed}]{\theta \text{ cont}^n} C \text{ s.t. } \theta \in \gamma^* \text{ (Range of } \gamma)$$

Then,  $\gamma_1(t) = \gamma(t) - z_0$  is a closed curve  
not passing through  $0$ . Let  $\theta$  be  
a cts arg of  $\gamma_1$  then

$$\frac{\theta(b) - \theta(a)}{2\pi} \in \mathbb{Z} \text{ independent}$$

on  $\theta$ .

= no. of revolutions completed  
around  $z_0$  by  $\gamma_1$  =  
Net change in angle/arg

= Index of  $z_0$  w.r.t  $\gamma$

= winding number of  $\gamma$  w.r.t  $z_0$

Notation:-	$\frac{\theta(b) - \theta(a)}{2\pi} = \text{Ind}_{\gamma}(z_0)$
------------	---

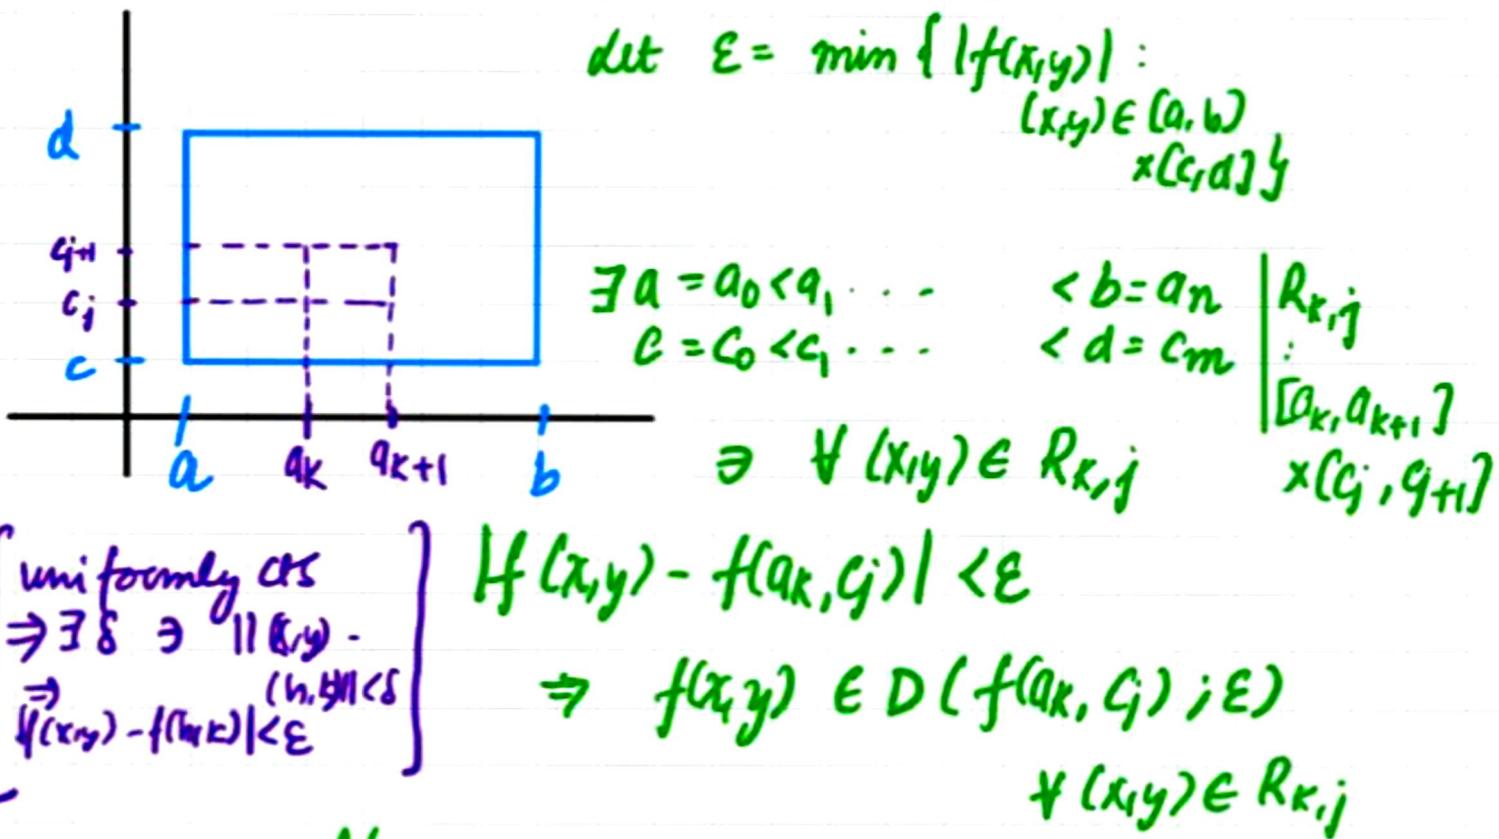

$\theta$  is cts arg of  $\gamma_1(t) = \gamma(t) - z_0$

# proof of ①

As  $[a, b] \times [c, d]$  is compact,  
 $f$  is uniformly continuous.

$$\text{let } \varepsilon = \min \{ |f(x, y)| :$$

$$(x, y) \in [a, b] \\ \times [c, d] \}$$

$\left[ \begin{array}{l} \text{uniformly cts} \\ \Rightarrow \exists \delta \exists \forall (x, y) - \\ |(x, y) - (x_0, y_0)| < \delta \end{array} \right] \quad |f(x, y) - f(x_0, y_0)| < \varepsilon$

$\Rightarrow f(x, y) \in D(f(a_k, c_j); \varepsilon)$

$\forall (x, y) \in R_{k,j}$

Also,

①  $\underline{0} \notin D(f(a_k, c_j); \varepsilon)$

$\left[ \begin{array}{l} \text{as if } 0 \in V \\ |f(a_k, c_j)| < \varepsilon \end{array} \right]$

Now, ①  $\Rightarrow$

$f|_{R_{k,j}} : R_{k,j} \rightarrow D(f(a_k, c_j), \varepsilon)$

must have  
 a cts arg.

summary: we sliced domain so  $f$  admits a cts arg  
 in each slice.

Now,  $R_{0,j} \cap R_{1,j} = [a_1, b] \times [c_j, c_{j+1}]$

$\theta_{0,j} - \theta_{1,j} = 2\pi l$  for some  $l \in \mathbb{Z}$

[Because, they have a common domain  
So, they have to give same value on this domain]

$\Rightarrow \checkmark$

we replace,  $\theta_{ij} \rightarrow \theta_{ij} + 2\pi l$  { no diff,  
stillcts+  
 $\in A(R_{ij})$ }

now we have a cts  
agreement over  $R_{ij} \cup R_{lj}$

Extend this agreement, finitely many  
times

Hence Proved.

# Riemann Integration

$f: [a, b] \rightarrow \mathbb{C}$

$f = u + iv$  then,  $\int f = \int u + i \int v$

$$= \boxed{\int_a^b u + i \int_a^b v}$$

## Basic Properties

i) Linearity,  $f, g \in \mathbb{R}$  then,

$$f+g \in \mathbb{R}$$

ii) Fundamental theorem I

$$F(x) = \int_a^x f(x) dx, \text{ if } f \in \mathbb{R}$$

- $F(x)$  is uniformly cts

- If  $f(x)$  is cts at ' $c$ ' then  $F$  is diff at ' $c$ ' and

$$F'(c) = f(c)$$

### iii) Fundamental Theorem - II

If  $f$  is differentiable and  $f'$  is R.I then

$$\int_a^b f' = f(b) - f(a)$$

iv)

### Integration by Parts

v)

### Change of Variables

$$\int (f \circ h)(s) h'(s) ds = \int f(t) dt$$

vi)

### Triangle Inequality

$$f \in R_b \Rightarrow |f| \in R \quad \&$$

$$\left| \int_a^b f \right| \leq \int_a^b |f|$$

Path

$$\gamma: [a, b] \xrightarrow{\text{cont}} C$$

$$\gamma^*: \gamma([a, b]) \subseteq U \text{ (we say } \gamma \text{ is a curve in } U\text{)}$$

If  $\gamma$  is piecewise  $C'$  i.e.  $\exists$  a partition

$$a = a_0 < a_1 < \dots < a_n = b \ni$$

$r|_{[a_j, a_{j+1}]}$  is differentiable and its derivative is cts.

then we call it a path

eg:-  $\gamma(t) = e^{it}$ ,  $0 \leq t \leq 2\pi$

=  $C^1$  curve,

$$\gamma(t) = \begin{cases} t & 0 \leq t \leq 1 \\ 1 + i(t-1) & 1 \leq t \leq 2 \end{cases}$$

## joining 2 Curves

$$\gamma_1 : [a_1, b_1] \xrightarrow{\text{cont}} C$$

$$\gamma_2 : [a_2, b_2] \xrightarrow{\text{cont}} C$$

we need a common domain

shift  $\gamma_2$

$$a_1 \quad b_1 \curvearrowright a_2 \quad b_2 \rightarrow b_1 + (b_2 - a_2)$$

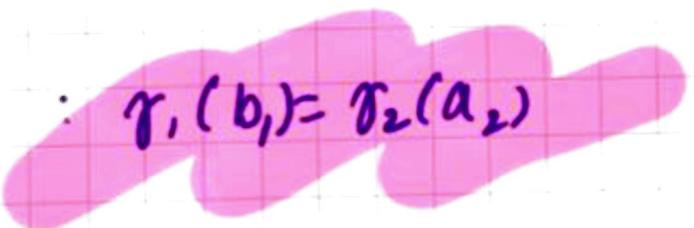

$$a_2 \rightarrow b_1$$

$$\left\{ \begin{array}{l} \gamma_1(t) : t \in [a_1, b_1] \\ \gamma_2(t) : t \in [b_1, b_1 + (b_2 - a_2)] \end{array} \right.$$

$$\gamma(t) =$$

$$\left\{ \begin{array}{l} \gamma_1(t) : t \in [a_1, b_1] \\ \gamma_2(t - b_1 + a_2) : t \in [b_1, b_1 + (b_2 - a_2)] \end{array} \right.$$

cts

→ If  $\gamma_1 + \gamma_2$  are path then

$(\gamma_1 + \gamma_2) = \gamma$  is also path.

\* It's the mapping and not the image that matters.

## Reparameterization

$\gamma: [a, b] \rightarrow \mathbb{C}$  path,

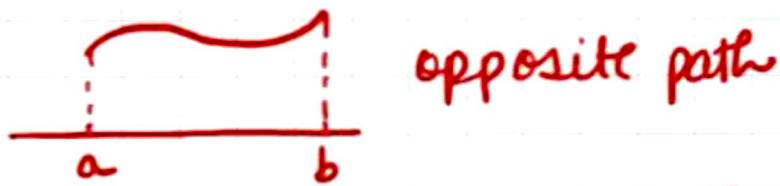

$[c, d] \xrightarrow{\phi} [a, b]$ ,  $\phi$  is one-one & onto,  
differentiable map.

( $\phi^{-1}$  is also diff)

We say,  $\gamma \circ \phi$  is reparameterization of  $\gamma$ .

e.g.  $\gamma: [a, b] \rightarrow \mathbb{C}$  is a path

$\tilde{\gamma}: \gamma(a+b-t) ; t \in [a, b]$

opposite path

## Remember Notation

$$\int_{\gamma} f = \int_a^b f(\gamma(t)) \gamma'(t) dt$$

$$\left[ \begin{array}{l} \int f(t) dt \\ \text{via path by } \gamma(t) \\ t \xrightarrow{\quad} \gamma(t) \\ \downarrow \text{change of} \\ \text{variable} \\ \int_a^b f(\gamma) \gamma'(t) dt \end{array} \right]$$

Examples :- Circle i.e  $\gamma(t) = z_0 + r e^{it}$   
 $= C(z_0, r)$   $t \in [0, 2\pi]$

$$\int f(z) dz = \int_{C(z_0, r)}^{} f(z_0 + re^{it}) (ire^{it}) dt$$

eg  $f(z) = z^n$ ,  $n > 1$

$$\int_{C(0, 1)}^{} f(z) dz = \int_0^{2\pi} (e^{it})^n \cdot (ie^{it}) dt$$

$$= \frac{1}{n+1} \left[ e^{i(n+1)t} \right]_0^{2\pi} = 0$$

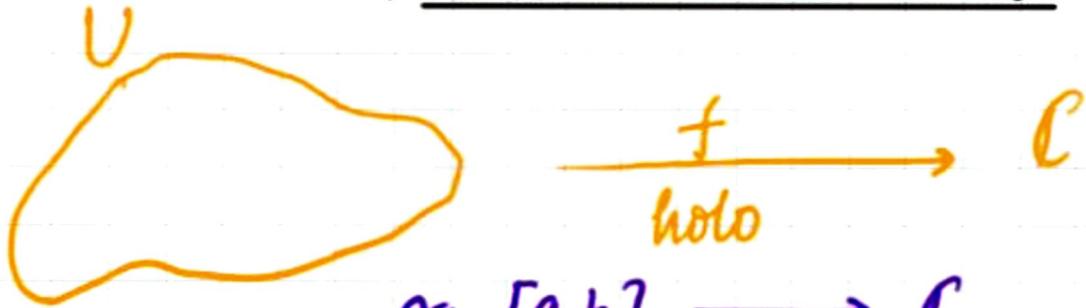

Q what if

$$n = -1$$

$$n < 0, n \neq -1$$

hint :-  $a^x = e^{x \ln a}$

# Fundamental Theorem

$$\gamma: [a, b] \longrightarrow \mathbb{C}$$

If  $\exists f: U \rightarrow \mathbb{C} \ni f' = f$  then

\*  $\int_{\gamma} f = f(b) - f(a)$

\* In particular, if  $\gamma$  is closed,  $\int_{\gamma} f = 0$

## FTC Chain Rule Corollary

$$F \underbrace{\left( f \circ \gamma \right)}_b' = \underbrace{f'(\gamma(t))}_{F'} \gamma'(t)$$

$$\int_a^b f(\gamma(t)) \gamma'(t) dt = f(\gamma(b)) - f(\gamma(a)) \quad \left\{ \begin{array}{l} f' = f \\ \text{where} \end{array} \right\}$$

$$\underbrace{\frac{F'}{n}}_n = f$$

Note:-  $\int_a^b z^n dz$ ,  $n \neq -1$

$$\underbrace{\frac{F}{n}}_n$$

Always admits primitive  $\rightarrow \frac{z}{n+1}$

for any path

$$\int_{\gamma} z^n dz = \frac{(\gamma(b))^{n+1} - (\gamma(a))^{n+1}}{n+1}$$

# Integration over Line Segments

$$[z, w] = (1-t)z + tw, \quad t \in [0, 1]$$

order important (direction of line)

$$\begin{aligned} \int f &= \int_0^1 f((1-t)z + tw)(w-z) dt \\ &= (w-z) \int_0^1 f((1-t)z + tw) dt \end{aligned}$$

# Integration over Re-parameterization

$$\begin{array}{ccc} [\gamma, d] & \xrightarrow{\phi} & [a, b] \\ (\gamma, b) & \xrightarrow{r} & \text{C path} \end{array}$$

$$f: \gamma^* \xrightarrow{\text{cont}} \mathbb{C}$$

$$\int f = \int_c^d f(\gamma \circ \phi) (\gamma \circ \phi)'(t) dt$$

$$= \int_c^d f(\gamma \circ \phi) \gamma'(\phi(t)) \phi'(t) dt$$

chain  
Rule

## Change of Variables

$$[c, d] \xrightarrow[\text{diff}]{\phi} [a, b] \xrightarrow[\text{cont}]{g} C$$

d Assume  $\phi' \in R$   $\phi(d)$

$$\int_c^d g(\phi(x)) \phi'(x) dx = \int_{\phi(c)}^{\phi(d)} g(y) dy$$

### Orientation

$\int f$  preserving ( $\phi$  gives  $a \rightarrow b$ )

$$\int_{\gamma \cdot \phi} f = \int_{\gamma} f$$

reversing ( $\phi$  gives  $b \rightarrow c$ )

How reparameterization affects integral value

$$\int_{\gamma \circ \phi} f = - \int_{\gamma} f \quad \text{In particular}$$

$$\int_{\tilde{\gamma}} f = - \int_{\gamma} f$$

- $\tilde{\gamma}$  is opposite path of  $\gamma$ , same mapping

Ex: Score/cheek  $\int_{\gamma + \gamma_2} f = \int_{\gamma_1} f + \int_{\gamma_2} f$

## ML inequality

$$\left| \int_{\gamma} f(t) dt \right| \leq M \int_a^b |\gamma'(t)| dt$$

$\underbrace{dt}_{d\gamma}$

Suppose  $\forall t \in [a, b]$ ,

$$|f(\gamma(t))| \leq M$$

$$\int_a^b |\gamma'(t)| dt = L_\gamma$$

as  $\gamma$  is compact  
 $f$  is continuous  
 $\Rightarrow \gamma^*$  has a maxima and a minima

## Index of a Curve

$$\text{eg:- } f(z) = \frac{1}{z}, \quad \gamma(t) = e^{it}, \quad t \in [0, 2\pi]$$

$$\int_{\gamma} f(z) dz = \int_0^{2\pi} e^{-it} \cdot e^{it} \cdot i dt = 2\pi i$$

$$\Rightarrow \frac{1}{2\pi i} \int_0^{2\pi} \frac{1}{z} dz = 1 \xrightarrow{\text{which is the}} \text{Index (0)} \quad \left[ \frac{2\pi - 0}{2\pi} = 1 \right]$$

of curve  $C(0; 1)$

Theorem: Let  $\gamma : [a, b] \xrightarrow[\text{path}]{} C$ . Then

$$\forall z \in C \setminus \gamma^*, \quad \text{Ind}_\gamma(z) = \frac{1}{2\pi i} \int_{\gamma} \frac{dw}{w-z}$$

Proof:  $\det z \notin \gamma^*$ , Consider  $d(z, \gamma^*) = \varepsilon > 0$

$z$  a closed  $S$  of compact  
= compact

[to find intervals in  
 $a \rightarrow b$ ]

Claim:  $\exists a = a_0 < a_1 < \dots < a_n = b$

$\forall j = 0, 1, \dots, n-1$

$t \in [a_j, a_{j+1}] \quad |g(t) - g(a_j)| < \varepsilon$

①

Proof:

$g$  is

uniformly ctz  $\therefore \forall \varepsilon > 0 \exists \delta > 0 \exists$

$|a_{j+1} - a_j| < \delta \Rightarrow |g(a_{j+1}) - g(a_j)| < \varepsilon$

Hence ✓.

In other words,

$g([a_j, a_{j+1}]) \subset D(g(a_j); \varepsilon)$

Also, by the choice of  $\varepsilon$ ,  $z \notin D(g(a_j); \varepsilon)$

Now,

Define  $f: W \rightarrow W - z$  (holo as polynomial)

$f(D(g(a_j); \varepsilon)) = D(g(a_j) - z; \varepsilon)$

Find a domain over which f has holo log

$0 \notin D(g(a_j) - z; \varepsilon)$  as  $z \notin \gamma^*$   
 $\Rightarrow f$  has a holo logarithm say  $g_j$   
on  $D(g(a_j); \varepsilon)$  as  $0 \notin \text{Img}(f)$   
on  $D$

$$\text{i.e. } f(w) = e^{g_j(w)} \text{ if } w \in D(\gamma(a_j); \epsilon)$$

$$\Rightarrow f'(w) = g_j'(w) e^{g_j(w)}$$

$$\Rightarrow \frac{1}{w-z} = \frac{f'(w)}{f(w)} = g_j'(w)$$

Denote  $\left| \gamma \right|_{[a_j, a_{j+1}]}$  by  $\gamma_j$

$$\text{Now, } \int_{\gamma_j} \frac{dw}{w-z} = g_j(\gamma_j(a_{j+1})) - g_j(\gamma_j(a_j))$$

$$\text{define: } \gamma = \sum_{i=1}^{n-1} \gamma_i \quad [\text{FTC}]$$

$$\begin{aligned} \text{then using prev. results } \int_{\gamma} \frac{dw}{w-z} &= \sum_{j=0}^{n-1} \int_{\gamma_j} \frac{dw}{w-z} \\ &= \sum_{j=0}^{n-1} g_j(\gamma_j(a_{j+1})) - g_j(\gamma_j(a_j)) \end{aligned}$$

[The reason we sliced is cuz we don't have a holomorphic function entire interval.]

$$\sum \underbrace{\operatorname{Re}(g_j(\gamma_j(a_{j+1})) - g_j(\gamma_j(a_j)))}_{\textcircled{1}} + i \sum \underbrace{\operatorname{Im}( )}_{\textcircled{2}}$$

$$\text{let } \theta_j = \operatorname{Im}(g_j)$$

$\theta_j$  is cont<sup>n</sup> on all partitions ( $\theta_j = \text{arg}$ )

(cont log  $\Leftrightarrow$  cont argument)

①

$$= \sum \left( \log |\gamma(a_{j+1}) - z| - \log |\gamma(a_j) - z| \right)$$

$\downarrow$   
Telescopic sum

$$\text{(I)} = \log |\gamma(b) - z| - \log |\gamma(a) - z| \\ = 0 \quad [\text{closed path}]$$

②

$$\sum_{j=0}^{n-1} \theta_j(\gamma_j(a_{j+1})) - \theta_j(\gamma_j(a_j))$$

$\theta|_{[a_j, a_{j+1}]}$  is also cts on  $[a_j, a_{j+1}]$   
while  $\theta$  is  $\text{arg}(\gamma(t))$ .

$$\Downarrow \theta(a_{j+1}) - \theta(a_j) = \theta_j(\gamma_j(a_{j+1})) - \theta_j(\gamma_j(a_j))$$

$$\Downarrow \text{(II)} = 2\pi i \theta(b) - \theta(a)$$

$\Rightarrow$  Hence Closed.

## Some Points :-

①  $z \rightarrow \frac{1}{2\pi i} \int_{\gamma^*} \frac{dw}{w-z}$  is a cts f<sup>n</sup>.

$$\text{Cl } \gamma^* \longrightarrow \mathbb{Z} = \text{Ind}_\gamma f^n \text{ is a holomorphic function}$$

In particular,

If  $S$  is connected subset of  $\text{Cl } \gamma^*$  then  $\text{Ind}_\gamma f^n$  is cts in  $S$ .

② furthermore,

$S$ : unbounded then,  $\forall R > 0, \exists z \in S$   
 $\exists w \in \gamma^* : |w-z| > R$

If not then

$$\begin{aligned} &\forall z \in S, \exists w_z \in \gamma^* \Rightarrow |z - w_z| \leq R \\ &\Rightarrow |z| \leq |z - w_z| + |w_z| \\ &\leq R + \sup |\gamma(t)| \text{ i.e bounded} \end{aligned}$$

Now,

$$|\text{Ind}_\gamma(z)| \leq \frac{1}{2\pi i} \int_{\gamma^*} \left| \frac{1}{w-z} \right| dw \leq \frac{1}{2\pi R} L_\gamma$$

$$= \frac{L_\gamma}{2\pi R}$$

eg:-

$\Rightarrow \text{Ind}_\gamma = 0$  on  $S$ . {Since continuous}

\*  $C(z_0; r) : t \longrightarrow z_0 + re^{it}$

$$\frac{1}{2\pi i} \int_{C(w_0, r)} \frac{dw}{w-z} = \begin{cases} 1 & : |z - z_0| < r \\ 0 & : |z - z_0| \geq r \end{cases}$$

# \* Zeros of Polynomial inside a Disc

$$P(z) \in \mathbb{P}[z]$$

$$P(z) = \prod_{i=1}^k (z - \alpha_i)^{m_i}$$

$$P(z) = (z - \alpha_1)^{m_1} Q(z)$$

$$\frac{P'(z)}{P(z)} = \frac{m_1(z - \alpha_1)^{m_1-1} Q(z) + Q'(z)(z - \alpha_1)^{m_1}}{Q(z)(z - \alpha_1)^{m_1}}$$

$$= \frac{m_1}{(z - \alpha_1)} + \underbrace{\frac{Q'(z)}{Q(z)}}$$

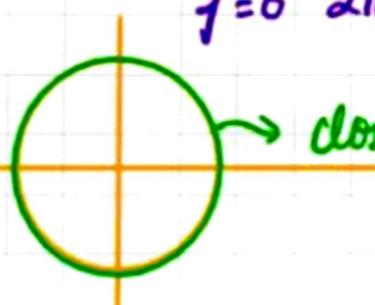

↓ open  $\Rightarrow$   
further differentiation

$$\frac{P'(z)}{P(z)} = \frac{m_1}{(z - \alpha_1)} + \frac{m_2}{(z - \alpha_2)} + \dots + \frac{m_k}{(z - \alpha_k)}$$

**Analysis :-** let  $D(z_0, r)$  be a disc

If  $P(z) \neq 0$  on boundary i.e.  $|z - z_0| = r$ .

$$\frac{1}{2\pi i} \int_{C(z_0, r)} \frac{P'(z)}{P(z)} dz = \sum_{j=0}^k \frac{1}{2\pi i} \int_{C(z_0, r)} \frac{m_j}{(z - \alpha_j)} dz$$

$\int_{\gamma(t_0, r)} \frac{m_j}{(z - \alpha_j)} dz = 1 \text{ or } 0$  depending if  $\alpha_j$  is inside or  
not.  
 think as winding Power of  $\alpha_j$

$t_0 + re^{it}$

$$= \sum_{0 \leq j \leq k} m_j (0 \text{ or } 1)$$

$=$  no. of zeros of  $P(z)$  inside  
 the Disc, containing  
 multiplicities

### A very important Result

Lemma  $\gamma: [a, b] \longrightarrow \mathbb{C}$  be closed path.  $z_0 \in \gamma^*$ . Then

$$\operatorname{Ind}_{\gamma}(z_0) \in \mathbb{Z}$$

Prof:-  $g(t) = \int_a^t \underbrace{\frac{\gamma'(s)}{\gamma(s) - z_0}}_I ds$ . Then if the I is cts at  $t$  then,  $g'(t) = \frac{\gamma'(t)}{\gamma(t) - s}$

Hence,

$$\frac{d}{dt} \left[ e^{-g(t)} (\gamma(t) - z_0) \right] = 0$$

whenever  $g'(t)$  exists.

$\Rightarrow e^{-g(t)} (\gamma(t) - s)$  is piecewise constant  
on  $[a, b]$

But  $e^{-g(t)} (\gamma(t) - s)$  is cts on  $[a, b]$

Hence, its constant.

$$\Rightarrow e^{-g(a)} (g(a) - z_0) = e^{-g(b)} (g(b) - z_0)$$

using  $g(a) = g(b)$

$$\text{we get } e^{-g(a)} = e^{-g(b)}, \text{ as } g(a) = 0,$$

$$e^{-g(b)} = 1$$

Hence,  $g(b) = 2\pi i n$

Check the roots series + Polynomial series

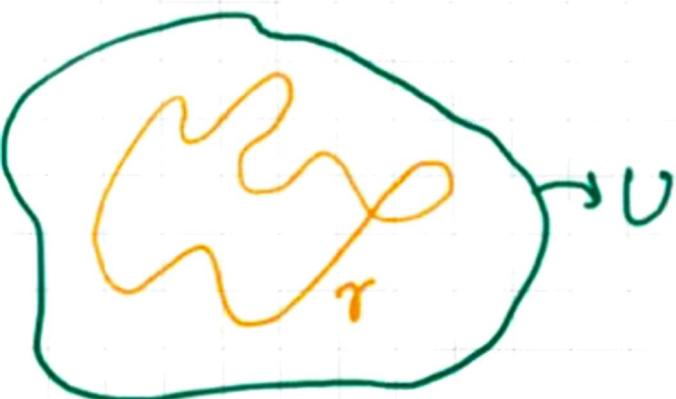

convergence.

# Cauchy Theory

$$U \subseteq \mathbb{C}$$

open

$$\gamma: [a, b] \xrightarrow[\text{closed}]{\text{path}} U$$

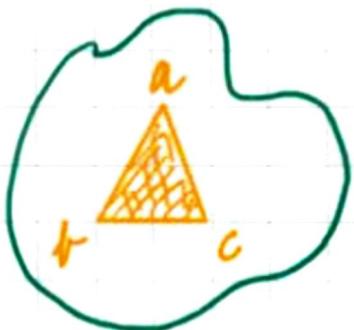

If  $\gamma + U$  satisfy the topological conditions below,  $\oint f: U \xrightarrow{\text{holo}} \mathbb{C}$

$$\boxed{\int\limits_{\gamma} f = 0}$$

## Cauchy Theorem for $\Delta$

$$U \subseteq \mathbb{C} \text{ open}, \quad \Delta \subseteq \mathbb{C}, \quad p \in U \xrightarrow{\text{Any point}}$$

triangle

$$\left\{ t_1 a + t_2 b + t_3 c : t_1, t_2, t_3 \geq 0 \text{ and } \sum t_i = 1 \right\}$$

All interior and boundary points included

$$f: U \xrightarrow{\text{cont}} \mathbb{C} \text{ and } f \text{ is holo on } U \setminus \{p\}$$
$$\Rightarrow \oint_{\partial \Delta} f = 0$$

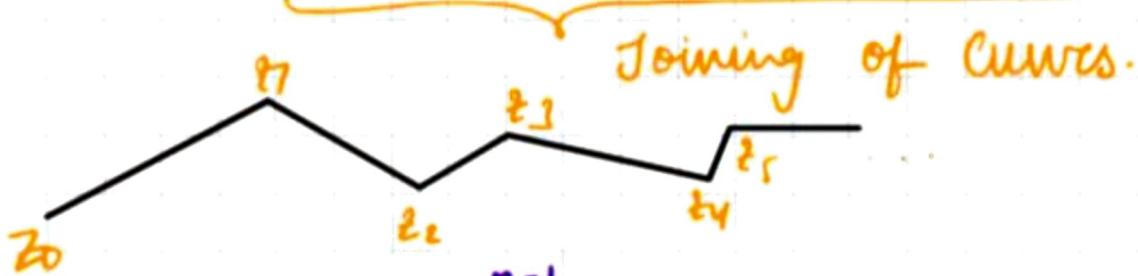

Intuition: continuing, if it is forced to be zero at p as well?

Note:-  $f$  does not necessarily admit a primitive,  
if  $f$  has a primitive,  $\int f = 0 \nabla$  closed paths  $\gamma$ .

For  $[z, w]$ ,  $\gamma(t) = (1-t)z + tw$  (line segment)

$$\int_{[z,w]} f = \int_0^1 f((1-t)z + tw)(w-z) dt$$

$$\rightarrow [z_0, z_1] * [z_1, z_2] * \dots * [z_{n-1}, z_n]$$

$$\int_{[z_0, z_1, \dots, z_n]} f = \sum_{j=0}^{n-1} \int_{[z_j, z_{j+1}]} f$$

$$\Rightarrow \Delta(a, b, c) \Rightarrow \int f = \int_{\partial \Delta(a,b,c)} f + \int_{[a,b]} f + \int_{[b,c]} f + \int_{[c,a]} f$$

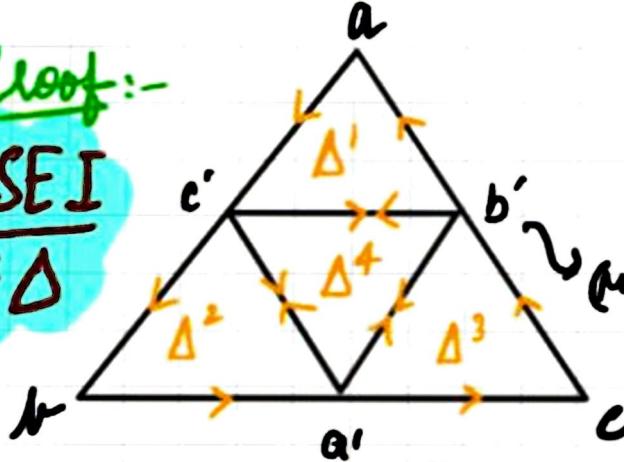

Note:-  $\partial \Delta(a, b, c) = \partial \Delta(b, c, a) = \partial \Delta(c, a, b) = -\partial \Delta(a, b, c)$

Here,  $\int_{\partial \Delta} f = 0$ , so orientation doesn't really matter.

Proof:-

CASE I

$P \notin \Delta$

$$\int f = \sum_{j=1}^4 \int_{\partial \Delta^{(j)}} f$$

(midpoints of the sides)

[exists  $c \in K$ ]  
 $\Leftrightarrow$

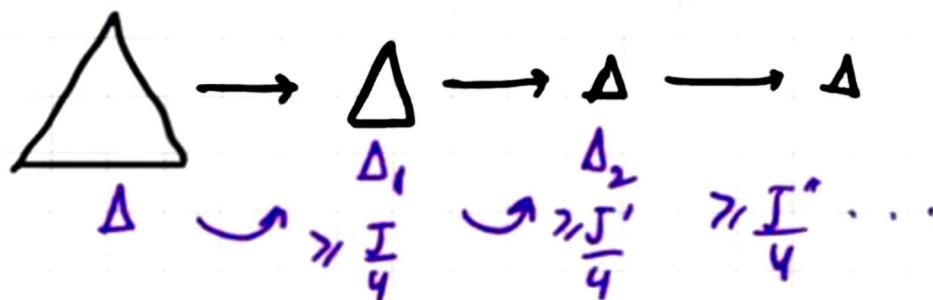

$$\left| \int_{\partial \Delta} f \right| \leq \left| \sum_{j=1}^4 \int_{\partial \Delta^{(j)}} f \right|$$

$$\exists j \in \{1, 2, 3, 4\} \ni \left| \int_{\partial \Delta^{(j)}} f \right| \geq \frac{J}{4}$$

choose the least  $\left| \int_{\partial \Delta^{(j)}} f \right| \nearrow$  in this.

$\det = J$

det this  $\Delta^{(j)} = \Delta_1$

$\Delta \geq \Delta_1, 2\Delta_1 \geq \dots$

$$4^2 \left| \int_{\partial \Delta_2} f \right| \geq 4 \left| \int_{\partial \Delta_1} f \right| \geq \left| \int_{\partial \Delta} f \right|$$

$\underbrace{= J}_{\text{length of } \partial \Delta \text{ (perimeter)}}$

det length of  $\partial \Delta$  (perimeter) =  $L_\Delta$

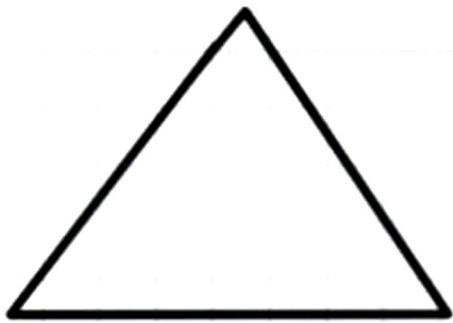

$$L_{\Delta_1} = \frac{L_\Delta}{2}$$

$$L_{\Delta_2} = \frac{L_\Delta}{4} \text{ and so on,}$$

$$L_{\Delta_n} = \frac{L_\Delta}{2^n}$$

$$\therefore 4^n \left| \int_{\partial \Delta_n} f \right| \geq J$$

$\Rightarrow$

For any 2 points in  $\Delta_n$ .

$d(x_1, y_1) < \text{diam } (\Delta_n)$   
 [property of diameter]

$$\therefore \text{diam } (\Delta_n) \leq L_{\Delta_n} = \frac{L_{\Delta}}{2^n} = \text{diam} \rightarrow 0$$

$$\Rightarrow \exists z_0 \in \Delta \Rightarrow \bigcap_{i=1}^{\infty} \Delta_i = \{z_0\}$$

[compact sets + diam  $\rightarrow 0 \Rightarrow$  non  $\emptyset$  intersection]

as  $z_0 \in \Delta \Rightarrow z_0 \neq p \Rightarrow f$  is holomorphic at  $z_0$ .

$$\Rightarrow \forall \epsilon > 0, \exists \delta > 0 \ni |z - z_0| < \delta,$$

$$|f(z) - f(z_0) - f'(z_0)(z - z_0)|$$

we are  
saying  
after  $N$ ,  
every point  
of  $\Delta_n$  lies  
within  $\delta$   
of  $z_0$

$$\left| \text{Let } N \in \mathbb{N} \text{ be } \Rightarrow \frac{L_{\Delta}}{2^N} < \delta. \right.$$

$$\text{now, } z \in \Delta_N \Rightarrow |z - z_0| \leq \text{diam } \Delta_N \leq \frac{L_{\Delta}}{2^N}$$

$$\text{Hence, } \forall n \geq N, \Delta_n \subseteq D(z_0, \delta) < \delta$$

$$\left| \int_{\partial \Delta_n} \left\{ f(z) - f(z_0) - f'(z_0)(z - z_0) \right\} dz \right|$$

$$\stackrel{(1)}{\leq} \stackrel{(2)}{\leq} \stackrel{(3)}{\leq} \epsilon L_{\Delta_n}^2$$

[ML inequality]

Also,

$$\textcircled{2} \text{ is constant and } \int \textcircled{2} = 0$$

$$\int \textcircled{2} = k \int (\partial \Delta_n)^2 dt \\ = 0$$

Hence

$$, \left| \int_{\partial \Delta_n} f(z) dz \right| \leq \frac{\epsilon L_\Delta^2}{4^n}$$

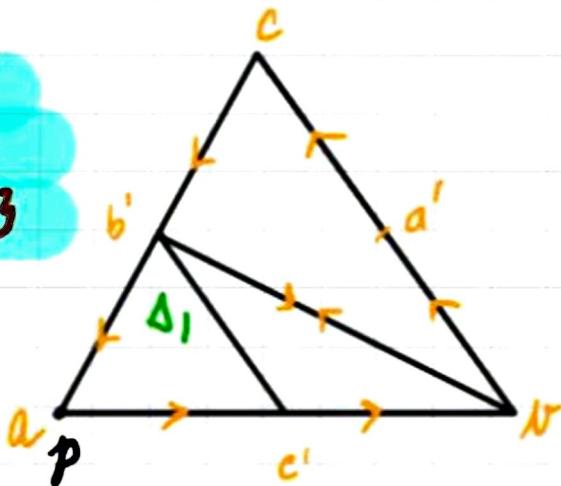

$$4^n \left| \int_{\partial \Delta_n} f(z) dz \right| \leq \epsilon L_\Delta^2$$

$$\text{Hence, } J \leq \epsilon L_\Delta^2$$

as  $\epsilon$  is arbitrary,  $J=0$

## CASE II

$p \in (a, b, c)$

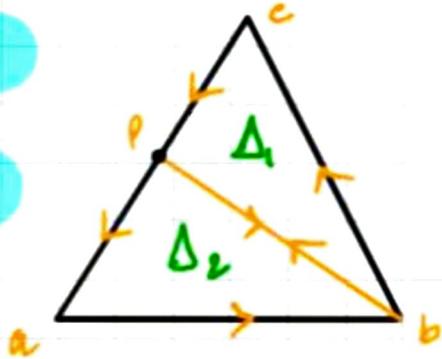

$\int f = \int f$  (as set  $\Delta$  into every where)  $\rightarrow$  CASE-I  
Hence Done

We keep reducing the  $\Delta$ s further in  $\Delta_1 \rightarrow \Delta_2$ .

$\int f = 0$  as diameter  $\rightarrow 0$

containing  $p$ .

CASE III  
 $p \in \text{edge}$

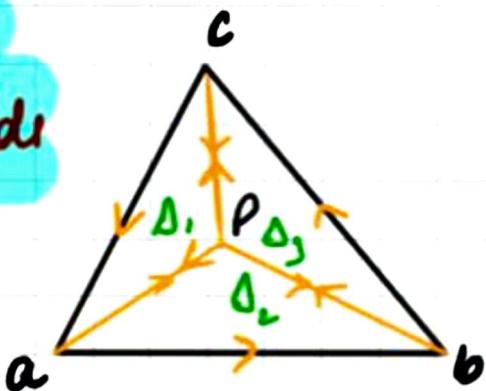

From Case II,

$$\int f = 0 = \int f = 0 \\ \partial\Delta_1 \quad \partial\Delta_2$$

Hence Proved.

Case IV

$p$  lies inside

$$\int f = \int f + \int f + \int f \\ \partial\Delta \quad \partial\Delta_1 \quad \partial\Delta_2 \quad \partial\Delta_3 \\ = 0$$

Cauchy Theorem for  
Open Convex Region

④  $U \subseteq \mathbb{C}$ , assume  $U$  is convex

$$\text{i.e. } [z_1, z_2] = \{(1-t)z_1 + tz_2 : 0 \leq t \leq 1\} \subseteq U$$

Conditions

1.  $p \in U \subseteq \mathbb{C}$ ,  $U$  is convex and open.
2.  $f: U \xrightarrow{\text{cts}} \mathbb{C}$ , holo at every point of  $U \setminus \{p\}$
3.  $\gamma: [a, b] \longrightarrow U$  (closed path)

then  $\exists F \in H(U) \ni f' = f \Rightarrow$

f admits primitive and

$$\int_U f = 0$$

① Region = open connected set.

Proof :-

$$z_0 \in U, f(z) = \int_f_{[z_0, z]}$$

Claim:  $f(z)$  is primitive for  $f$ .

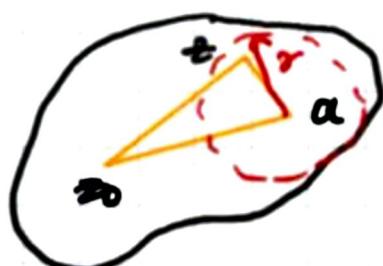

To prove:-  $F$  is diff &  $F' = f$ .

Let  $a \in U, \exists r > 0 \Rightarrow D(a, r) \subseteq U. \forall z \in D(a; r)$

$$\begin{aligned} (1) &:= \frac{f(z) - f(a)}{z-a} - f(a) \\ &= \frac{\int_f_{[z_0, z]} - \int_f_{[z_0, a]}}{z-a} - f(a) \end{aligned}$$

using Cauchy's theorem for a  $\Delta$

$$\int_f_{[a, z]} + \int_f_{[z, a]} + \int_f_{[a, a]} = 0$$

$$\Rightarrow (1) := \int_a^z f(z) - f(a) \frac{[a,z]}{z-a}$$

we can write  $f(a) = \int_{[a,z]} f(z) dz$

$$(1) := \int_{[a,z]} (f(z) - f(a)) dz$$

very important

$$|(1)| = \frac{1}{|z-a|} \left| \int_{[a,z]} f(a) - f(z) dz \right|$$

Now,  $f(z)$  is  $\text{cts}$  at  $a$   
 $\Rightarrow \exists \delta \ni |z-a| < \delta \Rightarrow |f(z) - f(a)| < \frac{\epsilon}{2}$

use of ML inequality

By ML inequality

$$|(1)| < \frac{1}{|z-a|} |z-a| \cdot \frac{\epsilon}{2} < \epsilon$$

Hence,  $F$  is differentiable and  $F'(z) = f(z)$

use of convexity:-

If  $z_0$  can be joined to any other point of  $U$   
 $\Rightarrow$  line joining them  $\subseteq U$ .

Defn:-  $U$  is star-shaped if  $\exists z_0 \in U \Rightarrow$   
 $\forall z \in U, [z_0, z] \subseteq U$

# Complex Analysis INTEGRATION

## FORMULA

- ①  $U \subseteq \mathbb{C}$  open, convex    ②  $f \in H(U)$ ,  $\gamma: [a, b] \xrightarrow{\text{closed path}} U$

Let  $z \in U \setminus \gamma^*$ .

$$g(w) = \begin{cases} \frac{f(w) - f(z)}{w - z} & : w \neq z \\ f'(w) & : w = z \end{cases}$$

clearly,  $g$  is holomorphic at every  $w \neq z$ ,  $g$  is C1 at  $w=z$ . Let  $g(w) = g(z)$ . We can apply Cauchy's theorem for open convex regions.

$$\int\limits_{\gamma} g = 0$$

$$\Rightarrow \int\limits_{\gamma} \frac{f(w) - f(z)}{w - z} = 0 \quad \{z \notin \gamma^*\}$$

$$= \frac{1}{2\pi i} \int\limits_{\gamma} \left( \frac{f(w) - f(z)}{w - z} \right) dw = \frac{1}{2\pi i} \int\limits_{\gamma} \frac{f(w) dw}{w - z} \stackrel{\text{constant}}{=} \frac{1}{2\pi i} \int\limits_{\gamma} \frac{f(z) dw}{w - z}$$

Hence,

$$\text{Ind}_\gamma(z) \cdot f(z) = \frac{1}{2\pi i} \int_{\gamma} \frac{f(w)dw}{w-z}$$

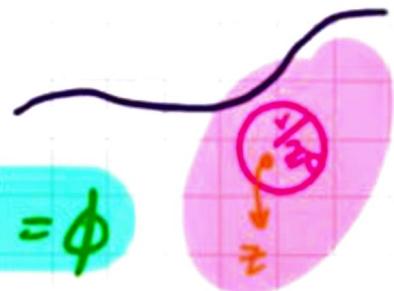

uses:-

- ① Index  $f(z)$  express as an integral
- ② Helps in directly calculating integrals of this form.

RHS

$$\frac{1}{2\pi i} \int_a^b \frac{f(\gamma(t)) \gamma'(t) dt}{\gamma(t) - z}$$

$$\text{take } z_0 \in U/r^*, D(z_0; r) \cap \gamma^* = \emptyset$$

Then,  $\forall z \in D(z_0; r)$

$$\frac{1}{2\pi i} \int_a^b \frac{f(\gamma(t)) \times \gamma'(t) dt}{\gamma(t) - z} = \frac{1}{2\pi i} \sum_{n=0}^{\infty} \int_a^b \frac{f(\gamma(t)) \gamma'(t) dt}{(\gamma(t) - z_0)^{n+1}} (z - z_0)^n$$

$$\left[ \text{write } \frac{1}{\gamma(t) - z} = \sum_{n=0}^{\infty} \frac{(z - z_0)^n}{(\gamma(t) - z_0)^{n+1}}, \text{ G.P because norm } < 1 \right]$$

$$= \sum_{n=0}^{\infty} \left( \frac{1}{2\pi i} \int_{\gamma} \frac{f(w) dw}{(w - z_0)^{n+1}} \right) (z - z_0)^n$$

just need a loop of  $f$  and a  $z$   
 $\exists z$  doesn't belong to curve  
 $\Rightarrow$  Expand around  $z_0$  for  $f(z)$ .

Some extra analysis

$$U \subseteq \mathbb{C}, f \in H(U), z_0 \in U \Rightarrow \exists R > 0 \Rightarrow$$

$U_{\text{new}}$   
which is convex  $\Rightarrow$  Cauchy's Integral formula in it

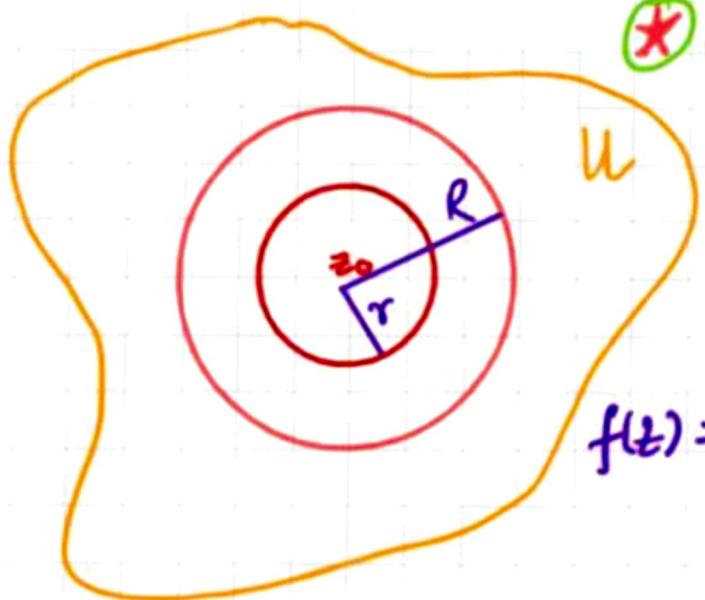

$$D(z_0, R) \subseteq U$$

find  $z_0$  using  $z$

let  $r \in (0, R)$  [opposite Analysis]

fix  $t \in D(z_0, r)$  {at index=1  $\Rightarrow$   
 $t \notin \gamma^*$ }

\* if  $r = C(z_0; r) \Rightarrow D(z_0; r) \cap \gamma^* = \emptyset$

$$f(z) = \frac{1}{2\pi i} \int_{\gamma(z_0; r)} \frac{f(w) dw}{w - z} \quad \begin{matrix} \text{Index: 1} \\ w \in D(r) \end{matrix}$$

$$f(z) = \sum_{n=0}^{\infty} \left( \frac{1}{2\pi i} \int_{\gamma(z_0; r)} \frac{f(w) dw}{(w - z_0)^{n+1}} \right) (z - z_0)^n$$

Hence, Inside this Disc,  $D(z_0; r)$ ,  $f$  can be expressed as a power series, centered at  $z_0$  (SEXY!)

$\therefore f$  is analytic

$f$  is holo  $\Leftrightarrow f$  is analytic

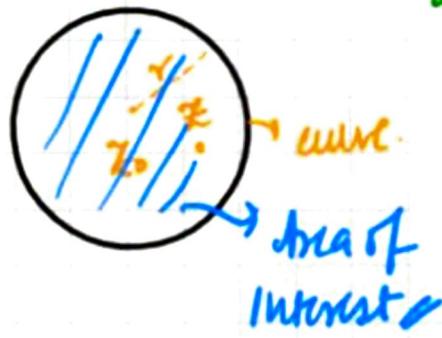

(locally speaking)

Corollary:- If  $f^n$  is holo, then  $f, f'$  ... all are holo  
i.e.  $f^n$  is  $\infty$  differentiable.

Eg:-  $f(x) = \begin{cases} e^{-yx^2} & : x \neq 0 \\ 0 & : x = 0 \end{cases}$

$f$  is  $\infty$  differentiable

$\Rightarrow f(z_0) = \frac{1}{2\pi i} \int_0^{2\pi} \frac{f(z_0 + re^{it}) (re^{it})}{(z_0 + re^{it}) - z_0} dt$

$f(z_0) = \frac{1}{2\pi} \int_0^{2\pi} f(z_0 + re^{it}) dt$

= Mean Value

i.e. Value of function at centre of circle, property

= average of function along boundary of  $f^n$  circle

Continuing the Analytic representation

$$\frac{f^{(n)}(z_0)}{n!} = \frac{1}{2\pi i} \int_{C(z_0; r)} \frac{f(w)}{(w - z_0)^{n+1}} dw$$

Remark:  $\oplus$  holds  $\forall z \in D(z_0; r)$

$n^{th}$  coefficient of power series above

## Cauchy's estimate

u.b of  $|f(w)|$   
on circle  
↓

Assume  $\exists M > 0 \ni |w - z_0| = r, |f(w)| \leq M$ .  
Then from ML inequality,

$$|f^{(n)}(z_0)| \leq n! \frac{M}{2\pi} \frac{1}{r^{n+1}}$$

i.e.  $|f^{(n)}(z_0)| \leq n! \frac{M}{r^n}$  ← very powerful

## Liouville's Theorem

$f \in HCC$  &  $f$  is bounded  $\Rightarrow f$  is constant  
 $\therefore f$  is entire

### Observe

④ doesn't change with  $r$ .

i.e.  $\forall r \in (0, R), z \in D(z_0; r)$

$$f(z) = \sum_{n=0}^{\infty} \frac{f^{(n)}(z_0)}{n!} (z - z_0)^n$$

basically  
 $z \in$  disc  
around  $z_0$ .

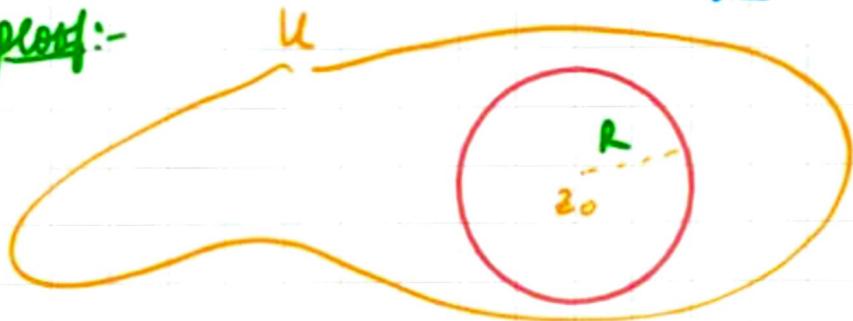

$$a_n = \frac{f^{(n)}(z_0)}{n!}$$

# Morera's Theorem

Let,  $U \subseteq \mathbb{C}$  open,  $f: U \xrightarrow{\text{cts}} \mathbb{C}$

Assume  $\oint_{\Delta} f = 0$ . Then  $f \in H(U)$ .

Proof:-

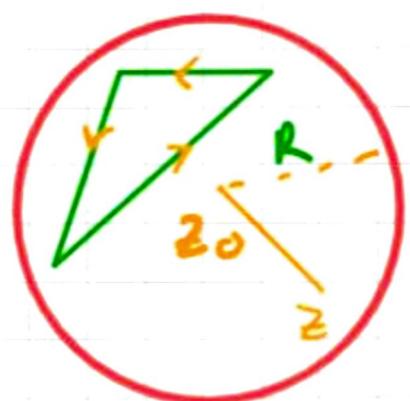

Let  $R > 0$  be

$$D(z_0; R) \subseteq U.$$

Note:-  $D(z_0; R)$  is open and convex.

$$f(z) = \int_{[z_0, z]} f, \quad \forall z \in D(z_0; R)$$

$f$  is primitive of  $f$ .  
see earlier theorem  
and use a similar proof

Hence,  $f$  is holomorphic

[complex  
differentiable  
is  
holomorphic]

$f'$  is holomorphic  
i.e.  $f' = f$  = holomorphic

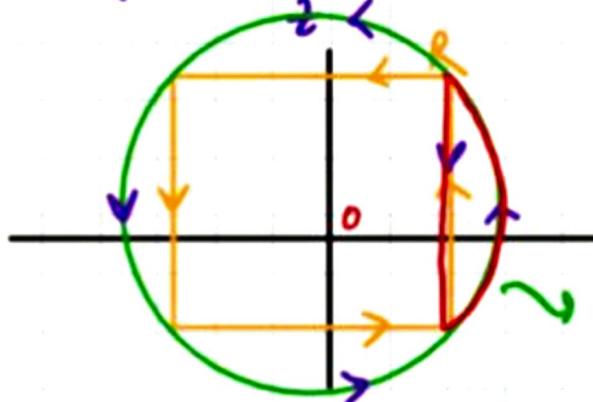

$$\Rightarrow f \in H(U)$$

Hence proved

Remark: If a  $f^n$  has primitive then it is  
holomorphic.

## Applications

$$1. f(z) = \frac{1}{z}, z \in \mathbb{C} \setminus \{0\}$$

$$Q: \int f$$

$\partial R$

consider circumcircle

$$\int f = 0 \quad (\text{By Cauchy's Theorem})$$

as you get a disc  
that contains this and  
avoids origin.

$$\Rightarrow \int f = \int f \quad \text{and so on.}$$

$$\Rightarrow \int f = \int f = 2\pi i$$

$\partial R \quad C(0; r)$

we shifted the contour of the funct.

$$2. f \notin \mathbb{R}, e^{-\pi z^2} = \int_{-\infty}^{\infty} e^{-\pi x^2} e^{2\pi i x z} dx - \textcircled{1b}$$

$\Rightarrow \text{if } z=0, \star \text{ becomes,}$

$$L = \int_{-\infty}^{\infty} e^{-\pi x^2} e^{2\pi i x z} dx$$

$\underbrace{-\infty}_{\text{use } T(\frac{1}{2}) = \sqrt{\pi}}$

(iii)  $\xi > 0$ ,

$$t \in [0, \xi]$$

$$O = \int_{-R}^R e^{-\pi x^2} dx + \int_0^\xi e^{-\pi(CR^2 + 2ixt - t^2)} i dt + \int_{-R}^R e^{-\pi(x+i\xi)^2} dx + \dots$$

Cauchy's  
Theorem

as  $R \rightarrow \infty$  is RMS (almost)

$$\begin{aligned} & \text{2nd term:-} \\ & + \text{4th term:-} \quad \left| \int_0^\xi e^{-\pi(R^2-t^2+2itR)} i dt \right| \leq \frac{\pi t^2}{e^{\pi R^2} \xi} \xrightarrow[R \rightarrow 0]{} 0 \end{aligned}$$

$$\begin{aligned} & \text{3rd term:-} \quad \int_{-R}^R e^{-\pi(x^2-\xi^2+2ix\xi)} dx \\ & = e^{\pi \xi^2} \int_{-R}^R e^{-\pi x^2} \cdot e^{-2\pi ix\xi} dx \end{aligned}$$

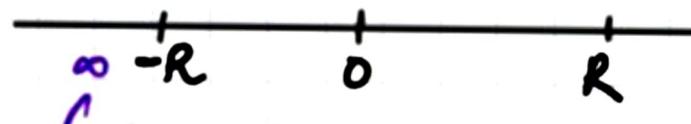

$$= e^{\pi \xi^2} \int_{-R}^R e^{-\pi x^2} \cdot e^{-2\pi ix\xi} dx$$

$$O = 1 - e^{\frac{\pi \xi^2}{2}} \int_{-\infty}^{\infty} \dots$$

Why for  $\delta < 0$

Hence Proved.

$$3. \int_0^\infty \frac{1-\cos x}{x^2} dx = \pi$$

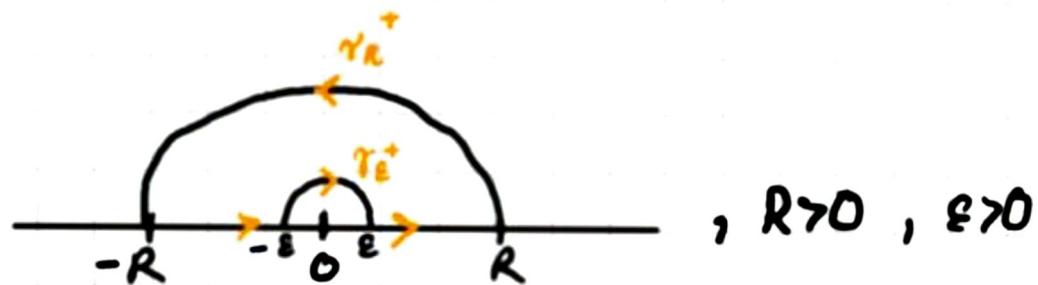

Because  
symmetric  
function  
about 0.

$$= \frac{1}{2} \int_{-\infty}^{\infty} \frac{1-\cos x}{x^2} dx$$

↓ Relate with a contour

convert  
in complex  
numbers

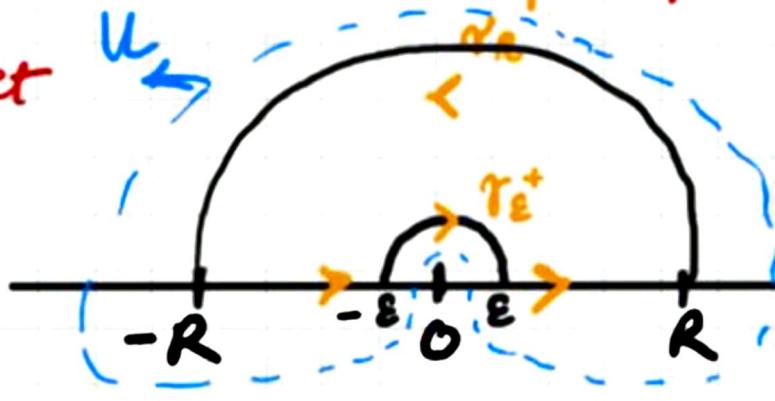

$$f(z) = \frac{1-e^{iz}}{z^2}, z \in \mathbb{C}\setminus\{0\}$$

move along the curve

Remarks

- \* to apply Cauchy's Theorem for open convex sets-
  - $f$  = cts everywhere, holomorphic except at most 1 point
  - closed curve
  - star-like set

for this we exclude 0.

Therefore,  $\int \frac{1-e^{iz}}{z^2} dz = 0$

$$= \int_{-R}^{-\epsilon} \frac{1-e^{iz}}{z^2} dz + \int_{\gamma_\epsilon}^{\epsilon} \frac{1-e^{iz}}{z^2} dz + \int_{\epsilon}^R \frac{1-e^{iz}}{z^2} dz + \int_{\gamma_R^+}^{\epsilon} \frac{1-e^{iz}}{z^2} dz \quad ①$$

Now we want  $z = x+iy, y>0$  pre computation  
to use ML inequality  $|e^{iz}| = |e^{-y+ix}| = e^{-y} \leq 1$

$$\Rightarrow \frac{|1-e^{iz}|}{|z^2|} \stackrel{\text{ineq.}}{\leq} \frac{2}{|z|^2}$$

$$\left| \int_{\gamma_R^+}^{\epsilon} \frac{1-e^{iz}}{z^2} dz \right| \leq \frac{2}{R^2} (\pi R) \rightarrow 0 \quad (R \rightarrow \infty)$$

for  $\gamma_\epsilon^+$ : expansion  $1-e^{iz} = -iz - \frac{(iz)^2}{2!} - \frac{(iz)^3}{3!} \dots$

$$\frac{1-e^{iz}}{z^2} = -\frac{i}{2} - \left[ \frac{i^2}{2!} + \frac{i^3 z}{3!} + \dots \right]$$

Let  $F(z) = \frac{i}{2!} + \frac{i^3 z}{3!} \dots$

$\forall |z| \leq 1, |F(z)| \leq \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} \dots \leq 1$

as  $\frac{1}{2^2} + \frac{1}{2^3} + \dots \rightarrow 1$

$$\text{when } z \neq 0, \quad \frac{1-e^{iz}}{z^2} = -\frac{i}{2} + E(z)$$

$$\int_{\gamma_\epsilon^+} (\quad) = -i \int_{\gamma_\epsilon^+} \frac{dz}{z} + \int_{\gamma_\epsilon^+} E(z) dz$$

$\downarrow$

$$\int_{\gamma_\epsilon^+} \frac{dz}{z} = \int_0^\pi \frac{1 \cdot 1 e^{i(\pi-t)}}{\epsilon e^{i(\pi-t)}} dt \leq \frac{1}{\epsilon} \pi \epsilon \rightarrow 0$$

$$= \pi i, \forall \epsilon > 0$$

Hence,  $\lim_{\epsilon \rightarrow 0} \text{RHS} = \pi$

$$\text{in } ①, \lim_{\epsilon \rightarrow 0} \int_{|z| \geq \epsilon} (\quad) = - \int_{\gamma_\epsilon^+} (\quad)$$

$$\text{i.e. } \int_{-\infty}^{\infty} \frac{1-e^{it}}{t^2} dt = \pi, \text{ taking Real part,}$$

$$\int_{-\infty}^{\infty} \frac{1-\cos x}{x^2} dx = \pi$$

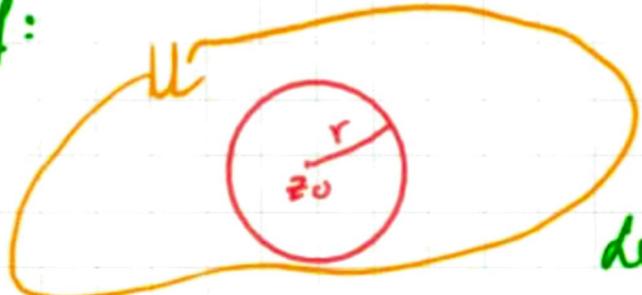

Hence Proved

## Equicontinuity

$f$ -family of functions,  $f: X \rightarrow C$ . fix  $x_0 \in X$ .  
 We say  $F$  is equicontinuous at  $x_0 \in X$ , if  $\forall \epsilon > 0$   
 $\exists \delta > 0 \ni d(x, x_0) < \delta \Rightarrow |f(x) - f(x_0)| < \epsilon,$   
 $\forall f \in F$

Theorem let  $U \subseteq \mathbb{C}$  open,  $\overline{f_U} \subseteq H(U)$ . Assume  $\overline{f_U}$  is uniformly bounded on each  $K \subseteq U$  compact (i.e.,  $\forall K \subseteq U$  compact,  $\exists M > 0 \ni \forall z \in K, f \in \overline{f_U}, |f(z)| \leq M$ )  
 Then,  $\overline{f_U}$  is equicontinuous.

Proof:

$$D(z_0; R) \subseteq U, 0 < r < R \\ \Rightarrow \overline{D(z_0; R)} \subseteq U.$$

let  $f \in \overline{f_U}$ , using Cauchy's Integral formula,

$$\textcircled{1} \quad f(z) - f(z_0) = \frac{1}{2\pi i} \int_{C(z_0; r)} f(w) \frac{z-w}{(w-z)(w-z_0)} dw$$

let  $M > 0 \ni \forall f \in \overline{f_U}$  & use CIF for  
 $|w-z_0| = r, |f(w)| \leq M$  (uniformly bounded)

$$\textcircled{1} \quad \Rightarrow |f(z) - f(z_0)| \leq \frac{1}{2\pi} M \cdot |z-z_0| \dots$$

Now,  $\left| \frac{1}{(w-z)(w-z_0)} \right| = \frac{1}{|w-z|r}$

to have a bound for  $\frac{1}{|w-z|}$ , + can't be very close to w.

⇒

If  $z \in D(z_0, r_{1/2})$ . Then  $\forall f \in \mathcal{P}$

$$|f(z) - f(z_0)| \leq \frac{M}{2\pi} |z - z_0| \cdot \frac{\pi}{\delta} \cdot \frac{1}{\delta}$$

$$= \underbrace{\frac{M}{\pi r^2} |z - z_0|}_{\text{Independent of } z}$$

given  $\epsilon > 0$ , clearly, we can choose

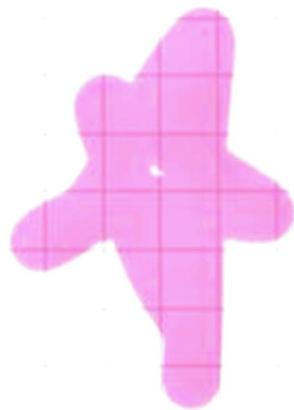

$$\delta < \frac{1}{2} \text{ and } \delta < \frac{\pi r^2 \epsilon}{M} \text{ and then}$$

$$\forall f \in \widetilde{\mathcal{P}} \quad |f(z) - f(z_0)| < \epsilon$$

Hence equicontinuity proved

Remark:-

This was an application of Cauchy's Integral Formula

# Applications of Morera's Theorem

\* Cauchy's Theorem for a  $\Delta$ :  $U \subseteq \mathbb{C}$ ,  $p \in U$ ,  $f: U \xrightarrow{\text{open}} \mathbb{C}$ ,  $f \in H(U \setminus \{p\})$

$$\Rightarrow \int_{\partial \Delta} f = 0$$

$\Rightarrow$  Morera's Theorem  $\Rightarrow f \in H(U)$   
In particular  $f$  is holo at  $p$ .

1  $U \subseteq \mathbb{C}$ ,  $n \in \mathbb{N}$ ,  $f_n \in H(U)$ . Let  $f_n \xrightarrow{n \rightarrow \infty} f$  pt.wise where  $f: U \rightarrow \mathbb{C}$ .

Assume  $f_n \rightarrow f$  uniformly on each  $K \subseteq U$   
 [i.e almost uniform <sup>compact</sup> convergence]

Then  $f \in H(U)$ . Also,  $f_n^{(K)} \xrightarrow{n \rightarrow \infty} f^{(K)}$ , almost uniformly

$\Rightarrow$  i) let  $\Delta \subseteq U$ , as  $\partial \Delta$  is cpt,  $f_n \xrightarrow{n \rightarrow \infty} f$  uniformly

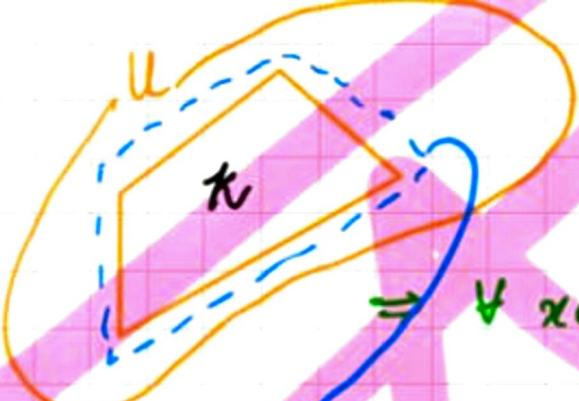

hence  $\int_U f_n \xrightarrow{n \rightarrow \infty} \int_U f$

$\Rightarrow \int_{\partial \Delta} f = 0 \Rightarrow$  using Morera's theorem ✓.

Exercise  
 $f_n: \gamma^* \xrightarrow{\text{cts}} \mathbb{C}$   
 $f_n \rightarrow f$  uniformly  
 $\Rightarrow f$  is cts &  
 $\int_{\gamma} f_n \xrightarrow{n \rightarrow \infty} \int_{\gamma} f$

Take even if  
 $f_n$  is not cts.

(ii)

$$\epsilon := d(z, \mathbb{C} \setminus U) > 0$$

$$\inf \{ |z - w| : z \in K, w \in \mathbb{C} \setminus U \}$$

$$\Rightarrow \forall x \in K, D(x; \epsilon) \subseteq U \text{ (if } w \notin U \Rightarrow y \in D(x; \epsilon) \text{)}$$

Now,  $0 < r < \epsilon$ ,  $\forall x \in K, \bar{D}(x; r) \subseteq D(x; \epsilon) \subseteq U$

$$C := \{z \in \mathbb{C} : d(z, K) \leq r\}$$

$$K \subseteq C$$

$C$  is compact  $\left\{ \begin{array}{l} \text{closed, as } d(x, K) \text{ is continuous} \\ \text{bounded} \end{array} \right.$

because

$$\exists M > 0 \Rightarrow \forall x \in K, |x| \leq M.$$

Let  $z \in C$ , since  $K$  is compact  $\exists k \in K \ni d(z, k) = |z - k|$

$$|z| \leq |z - k| + |k| \leq d(z, k) + |k|$$

$$\leq \epsilon + M$$

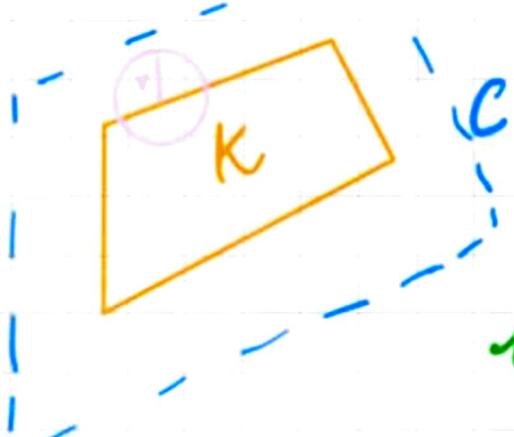

This  $C$  is called thickening of  $K$

Let  $z \in K$ . Clearly,  $\overline{D(z; r)} \subseteq C$  because if

$$|w - z| \leq r \Rightarrow d(w, K) \leq |w - z| \leq r$$

Thus,  $C$  is cpt,

$f_n \rightarrow f$  uniformly on  $C$ .  
(Assumptions)

use Cauchy's estimate on  $C(z; r)$

we get,  $|f_n'(z) - f'(z)| = |(f_n - f)'(z)|$

$$\leq \frac{1}{2} \sup_C |f_n - f|, \quad \begin{array}{l} \text{Bounded} \\ \text{Because} \\ z \in K \\ C \text{ is bounded} \end{array}$$

or  $f_n \rightarrow f$  uniformly,

$\forall \epsilon > 0, \exists N \in \mathbb{N} \ni \forall n > N, \forall z \in C,$

$$|f_n(z) - f(z)| \leq \frac{\epsilon}{2}$$

$$\Rightarrow \forall n > N, \sup_C |f_n - f| \leq \frac{\epsilon}{2} < \epsilon$$

$$\Rightarrow \forall n > N, |f_n'(z) - f'(z)| < \epsilon, \forall z \in K$$

Hence, converges uniformly almost.

Extend this finitely to  $K$ .

### Crux

1. Cauchy estimate applicable :-  $f \in H(U)$ ,  $U$  is convex  
and Bounded over a circle

for this we used  
thickening of compact set

\* The convergence of power series and their derivatives  
is a special case of this.

$$2. f(z) = \int_{\gamma} \frac{f(t)}{g(t)-z} dt, z \in \mathbb{C} \setminus \gamma^* \text{ is holo.}$$

General version :-

$$f(z) = \int_a^b \frac{f(z,t)}{g(t)-z} dt, \forall z \in U.$$

2 variable, 1 variable  
at

Then,  $f$  is holo and  $z$ , fixt  
holo at

$\forall z \in U,$

$$f'(z) = \int_a^b \frac{\partial f(z,t)}{\partial z} dt$$

now:- consider  $f(z)$ , wtr.  $t$  be apoly,  $t \in \mathbb{C} \setminus \gamma^*$   
 $\int_a^b \frac{f(\gamma(t)) g'(t)}{g(t)-z_0} dt = \int_a^b \frac{h(t)}{g(t)-z_0} dt$   
 $\text{is holo}$

\*  $f: U \times [a,b] \xrightarrow{dt} \mathbb{C}$ ,  
 $U \subseteq \mathbb{C}$   
open

\*  $f$  is holo in  $z$   
 $(\forall$  fixd  $t$   
 $z \rightarrow f(z,t)$   
is holo.

\*  $U \times [a,b]$  has sup  
metric i.e.  
 $d((t_1, t_1), (t_2, t_2))$   
 $= \max \left\{ |z_1 - z_2|, |t_1 - t_2| \right\}$

This is called

Liebniz Rule of diff  
under Integration

take  
 $f(z,t) = \frac{f(t)}{g(t)-z}$   
clearly,  $t \in \mathbb{C} \setminus \gamma^*$   
 $\Rightarrow$  holo  
 $\Rightarrow$  use Liebniz Rule

Proof :-  $\Delta \subseteq U$  &  $t \in [a, b]$ ,

(Cauchy theorem for  $\Delta \Rightarrow \int f(z, t) dz = 0$ )

$$\Rightarrow \int_a^b \int_{\partial\Delta} f(z, t) dz dt = 0 \xrightarrow[①]{\text{change of order}} \int_{\partial\Delta} \int_a^b f(z, t) dt dz = 0$$

Hence,  $\int_{\partial\Delta} f(z) dz = 0$

$\Rightarrow f$  is holomorphic using  
Morera's theorem.

*Another Proof*

Recall :-  $\varphi : [a, b] \xrightarrow{ds} R$ ,

$$\lim_{n \rightarrow \infty} \frac{dt}{n} \sum_{r=0}^{n-1} \varphi(a + r \frac{b-a}{n}) = \int_a^b \varphi$$

$$f_n(z) = \frac{b-a}{n} \sum_{r=0}^{n-1} f(z, a + r \frac{b-a}{n}), \quad \forall z \in U$$

Clearly,  $\forall z \in U$ ,  $f_n(z) \xrightarrow{n \rightarrow \infty} f(z)$

To show,  $f_n(z) \rightarrow f(z)$  a.u.

Let  $K \subseteq U$ . Since  $f$  is  $ds$  on  $K \times [a, b]$ .  $f$  is uniformly  $ds$  on it.

Let  $\epsilon > 0$ ,  $\exists N \in \mathbb{N} \ni \forall n > N$  &  $j = 0, 1, \dots, n-1$ ,

such that  $|z - s| < \delta$  |  $z, s \in [a + j \frac{b-a}{n}, a + (j+1) \frac{b-a}{n}]$

$f$  is uniformly  $\text{ct}$   $\Rightarrow |f(z, t) - f(z, s)| < \varepsilon_1/2$

as  $N$  makes  $\delta$ . Suppose  $z \in K$

$$|F_n(z) - F(z)| = \left| \frac{b-a}{n} \sum_{r=0}^{n-1} f(z, r \cdot \frac{b-a}{n}) - \int_a^b f(z, t) dt \right|$$

$$\leq \left| \frac{b-a}{n} \sum_{r=0}^{n-1} f(z, r \cdot \frac{b-a}{n}) - \sum_{r=0}^{n-1} \int_{a+r \cdot \frac{b-a}{n}}^{a+(r+1) \cdot \frac{b-a}{n}} f(z, t) dt \right|$$

$$= \left| \sum_{r=0}^{n-1} \left( \int_{a+r \cdot \frac{b-a}{n}}^{a+(r+1) \cdot \frac{b-a}{n}} f(z, t) dt - \dots \right) \right|$$

$$= \left| \sum_{r=0}^{n-1} \int_{a+r \cdot \frac{b-a}{n}}^{a+(r+1) \cdot \frac{b-a}{n}} f(z, a+r \cdot \frac{b-a}{n}) - f(z, t) dt \right|$$

outside then

$$\leq \sum_{r=0}^{n-1} \varepsilon \frac{(b-a)}{n} = \boxed{\varepsilon(b-a)}$$

$\left[ \begin{array}{l} r \cdot \frac{b-a}{n} \text{ and} \\ t \text{ are in same} \\ \text{interval for} \end{array} \right]$

Hence  $f(z) \rightarrow f_n(z)$  a.u

Hence  $f(z)$  is holomorphic

Also, seq. of derivatives also converges.

$$f_n'(z) = \frac{b-a}{n} \sum_{r=0}^{n-1} \frac{\partial f}{\partial z} \Big|_{a+r \cdot \frac{b-a}{n}}$$
$$\xrightarrow{n \rightarrow \infty} \int_a^b \frac{\partial f}{\partial z}(z, t) dt$$

Liouville's Theorem :-  $f \in H(C)$  & bdd  $\Rightarrow f$  is constant

Fundamental theorem of

algebra

$P(z) \in \mathbb{C}[z]$ ,  $\deg P(z) \neq 0 \Rightarrow P(z)$  has a zero.

Proof:- Assume contrary,

$$f(z) = \frac{1}{P(z)}, z \in \mathbb{C} \text{ is entire}$$

We show  $\exists M > 0 \ni |P(z)| \geq M$ . W.L.G

assume  $P$  is monic, i.e  $P(z) = z^d + a_{d-1}z^{d-1} + \dots + a_0$

$$\Rightarrow |P(z)| \geq |z|^d \left( 1 - \left| \frac{a_{d-1}}{z} + \dots + \frac{a_0}{z^d} \right| \right)$$

$$\left| \frac{a_{d-1}}{z} + \cdots + \frac{a_0}{z^d} \right| \leq \left| \frac{a_{d-1}}{z} \right| + \cdots + \left| \frac{a_0}{z^d} \right| - \textcircled{1}$$

$\leq (|a_{d-1}| + \cdots + |a_0|) \cdot \frac{1}{|z|}$ , whenever

$$\exists N \in \mathbb{N} \Rightarrow (|a_{d-1}| + \cdots + |a_0|) \frac{1}{N} < \frac{1}{2} \quad \text{if } |z| \geq N$$

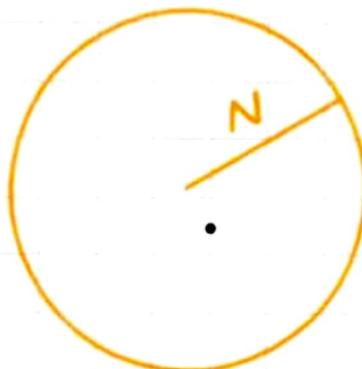

$\Rightarrow |z| \geq N$ ,

$$(|a_d| + \cdots + |a_1|) \frac{1}{|z|} \leq \frac{1}{2}$$

$\Rightarrow$  From (\*),

$$|P(z)| \leq \frac{1}{2}$$

$$\Rightarrow \forall |z| \geq N, |P(z)| \geq \frac{|z|^d}{2} > \frac{N^d}{2}$$

$|P(z)| > \frac{N^d}{2}$ . Now as

$D(0, N)$  is compact,  $\exists M_1 > 0 \Rightarrow$

$|P(z)| > M_1, \forall z \in \overline{D(0, N)}$

Let  $M := \min \left\{ \frac{N^d}{2}, M_1 \right\}$ . Then  $\forall z \in \mathbb{C}, |P(z)| > M$ .

# GLOBAL CAUCHY THEOREM

$U \subseteq \mathbb{C}$ ,  $\gamma$ -closed path,  $\gamma^* \subseteq U$ ,  $f \in H(U)$

open

$$\begin{aligned} \rightarrow U \text{ is convex} &\Rightarrow \int f = 0 \\ \nexists \Delta &\rightarrow \int f = 0 \end{aligned}$$

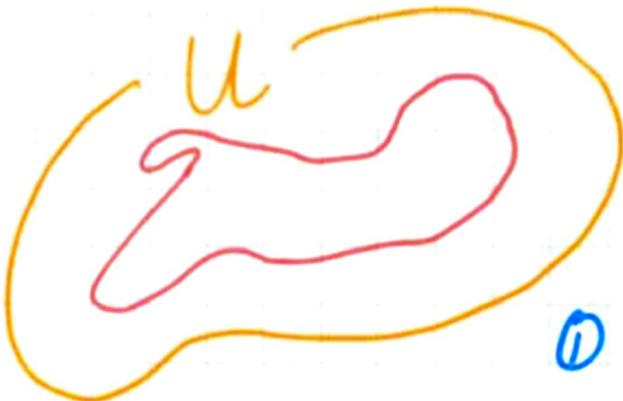

New Conditions

[Both r and U]  
[r small]

Condition on  $\gamma$  or  $U$   
was enough to get  
Result

Conditions are stringent  
 $\Rightarrow$  Extent of application  
is less.

## GLOBAL CAUCHY THEOREM

①  $U \subseteq \mathbb{C}$ ,  $\gamma: [a,b] \rightarrow U$  closed path

②  $\forall z \in \mathbb{C} \setminus U$ ,  $\text{Ind}_\gamma(z) = 0$

Then, at least one (and hence both) of  
following equivalent statement holds:-

(C1)  $\forall f \in H(U)$ ,  $\int_U f = 0$

(C2)  $\forall f \in H(U)$ ,  $z \in U \setminus \gamma^*$

$$\text{Ind}_\gamma(z) f(z) = \frac{1}{2\pi i} \int_{\gamma^*} \frac{f(w)}{w-z} dw$$

# Proof of Equivalence of C.1 and C.2

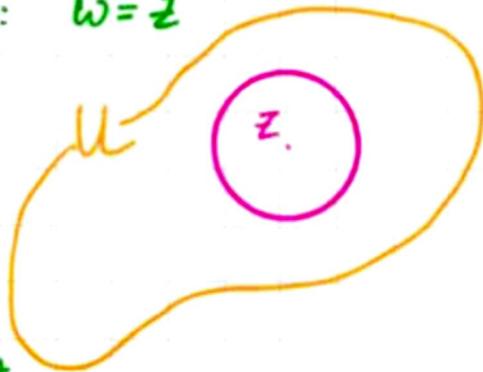

$$\underline{C.1 \Rightarrow C.2}$$

$$g(w) = \begin{cases} \frac{f(w)-f(z)}{w-z} & : w \neq z \\ f'(z) & : w = z \end{cases}$$

$$\Rightarrow g \in H(U \setminus \{z\})$$

+ cts in  $U \setminus \{z\}$ .

- Let  $D(z, r) \subseteq U$ . As  
g is cts on disc & holo in  
 $D(z, r) \setminus \{z\}$ . g is holo at  
 $z$  as well.

- From C.1,  $\int\limits_{\gamma} g(w) dw = 0 \Rightarrow \int\limits_{\gamma} \frac{f(w)-f(z)}{w-z} dw = 0 [z \notin U]$

Hence Done

$$\underline{C.2 \Rightarrow C.1}$$

[Fix  $z \in U \setminus \gamma^*$ ] Consider  $g(w) = (w-z)f(w)$ ,  $\forall w \in U$ .

$$\Rightarrow \int\limits_D g(z) \text{Ind}_\gamma(z) = \frac{1}{2\pi i} \int\limits_{\gamma} \frac{g(w)}{w-z} dw = \frac{1}{2\pi i} \int\limits_{\gamma} f$$

Hence proved

# Proof of C1

$\Rightarrow g: U \times U \longrightarrow \mathbb{C}$

$$g(w, z) = \begin{cases} \frac{f(w) - f(z)}{w - z} & : w \neq z \\ f'(z) & : w = z \end{cases}$$

We show that  $\forall z \in U \setminus r^*, \int\limits_r g(w, z) dw = 0$

Step 1 -  $z \mapsto \int\limits_r g(w, z) dw, \forall z \in U$  is holomorphic

① Claim -  $g$  is CTI  $\left\{ \begin{array}{l} \text{use} \\ \text{sup norm} \end{array} \right\}$

Proof - Observe  $w \neq z, g(w, z) = \frac{f(w) - f(z)}{w - z}$

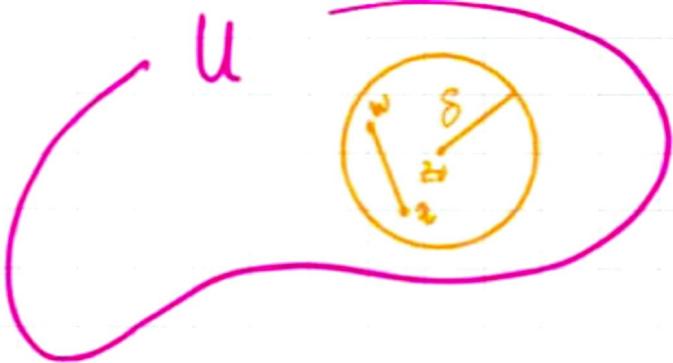

$$[\text{FTC}] = \frac{1}{w - z} \int_{[z, w]} f' = \int_0^1 f'((1-t)z + tw) dt$$

$$w = z, g(w, z) = f'(z) = \int_0^1 f'((1-t)z + tw) dt$$

at  $(w_0, z_0) \in U \times U$ . If  $w_0 \neq z_0$ ,  $g$  is continuous at  $(w_0, z_0)$

So assume,  $w_0 = z_0$ . Since  $f'$  is CTI at  $z_0$ .

$\forall \varepsilon > 0, \exists \delta > 0 \exists \forall u \in D(z_0, \delta), |f'(u) - f'(z_0)| < \frac{\varepsilon}{2}$

Let,  $w, z \in D(z_0; \delta)$ .

Then

$$|w - w_0|, |z - z_0| < \delta, \text{ i.e.}$$

$$\Rightarrow \forall t \in [0, 1], \quad d((w, z), (w_0, z_0)) < \delta$$

$$(1-t)z + tw_0 \in D(z_0; \delta) \Rightarrow$$

$$\begin{aligned} |g(w, z) - g(w_0, z_0)| &= \left| \int_0^1 f((1-t)z + tw_0) - f((1-t)z_0 + tz_0) dt \right| \\ &\leq \left| \int_0^1 f'((1-t)z + tw_0) - f'((1-t)z_0 + tz_0) dt \right| \\ &\leq \int_0^1 1 dt \\ &\leq \frac{\delta}{2} < \varepsilon. \end{aligned}$$

Hence it is continuous

②  $\forall z \in U, w \mapsto g(w, z)$  is holo. Similarly  
 $\forall w \in U, z \mapsto g(w, z)$  .. ..

REMARK: use Moreras Theorem

$$\int_r^y g(w, z) dz = \int_a^b g(g(t), z) g'(t) dt$$

Consider  $[a, b] \times U \rightarrow \mathbb{C}$

$$(t, z) \mapsto g(g(t), z) g'(t)$$

[using ②, it is holo if  $a$  it is fixed]

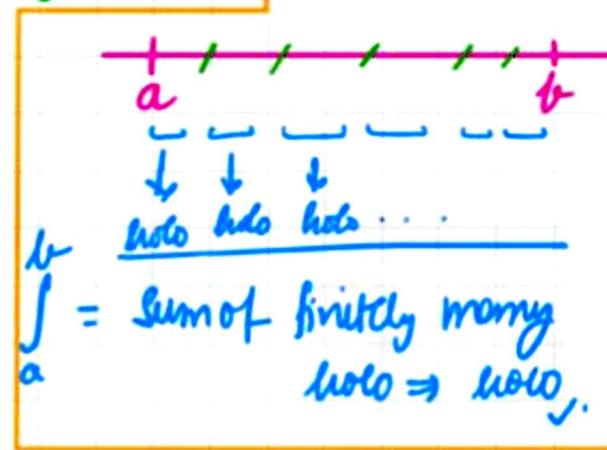

2. If  $\gamma$  is  $C^1$  [if piecewise take partitions of  $(a, b)$ ]  
 $\Rightarrow f(z) = \int_a^b g(\gamma(t), b) \gamma'(t) dt$  is holo

[Leibniz theorem]

Step 2 - extending  $f(t)$  from  $U \rightarrow \mathbb{C}$   
 $V = \{z \in \mathbb{C} \setminus \gamma^*: \text{Ind}_\gamma(z) = 0\}$

Clearly  $\mathbb{C} \setminus U \subset V \Rightarrow$

Let  $z \in U \cap V$   $U \cup V = \mathbb{C}$   
 $\int_U g(w, z) dw = \int_U \frac{f(w) - f(z)}{w-z} dw$

$$= \int_U \frac{f(w)}{w-z} dw - 2\pi i f(z) \text{Ind}_\gamma(z)$$

as  $z \in V \Rightarrow = 0$

Define  $h: \mathbb{C} \rightarrow \mathbb{C}$

$$h(z) = \begin{cases} \int_U g(w, z) dw, & z \in U \\ \int_U \frac{f(w)}{w-z} dw, & z \in V \end{cases}$$

Since,  $h(z)$  is holo at  $U, V$  and  $U \cap V \Rightarrow$

$h(z)$  is entire

Step 3:  $\gamma$  is bounded, hence it is constant by Liouville's theorem

$\gamma^*$  is compact  $\Rightarrow \exists R > 0 \ni \gamma^* \subseteq D(0, R)$

$$\Rightarrow C \setminus \gamma^* = G_1 \cup G_2 \cup \dots$$

↑  
connected  
components

$C \setminus D(0, R)$  is connected open set  
 $\Rightarrow$

say  $G$  of  $C \setminus \gamma^*$   $\exists$  connected component.

$\Rightarrow G$  is unbounded. As

$\text{Ind}_y \equiv 0$  on any unbounded component of  $C \setminus \gamma^*$ .

$G \subseteq V$ . ★

$C \setminus V \subseteq \overline{C \setminus D(0, R)} \subseteq G \subseteq V$ . Hence

Since  $h$  is cts, thus  $C \setminus V$  is bounded.

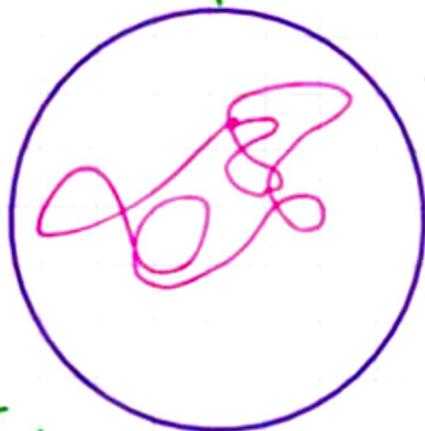

$\Rightarrow h$  is bounded on  $\overline{C \setminus V}$  [since, it is compact]

\* To show  $h$  is bounded on  $V$ .

$$M > R \quad V'_M = \{z \in V : d(z, \gamma^*) < M\}$$

$$V''_M = \{z \in V : d(z, \gamma^*) \geq M\}$$

clearly  $V = V'_M \sqcup V''_M$

① Obs :  $V_M'$  is bounded

Let  $z \in V_M'$ .  $\exists w \in \gamma^* \ni |w-z| < M$

$$|z| \leq |z-w| + |w| < M + R$$

$\Rightarrow h$  is bdd on  $V_M'$

② Let  $z \in V_M''$ .

$$|h(z)| = \left| \int_{\gamma} \frac{f(w)}{w-z} dw \right| \leq \sup_{\gamma^*} |f| \cdot \frac{L}{M}$$

Hence,  $h$  is bounded on  $V_M''$ .

$\Rightarrow h$  is bounded everywhere

$\Rightarrow h$  is constant

Step 4 :-  $C=0$  [  $h(z)=C$  ]

$\forall M > R$ ,  $V_M'$ ,  $V_M''$  defined before.

Observe that :  $V_M'' \neq \emptyset$ . otherwise  $V = V_M'$  and  $V$  can't be bounded ( $C \subseteq V$ )

Hence,  $|h(z)| \leq \frac{Ly|f|\sup_{\gamma^*}}{M}$ ,  $\forall M > R$

$M = \text{arbitrary} \Rightarrow h(z) = 0$ .

If  $\gamma$  satisfies  $\forall z \in C \setminus U \quad \text{Ind}_\gamma(z) = 0$

Then  $\gamma$  is  $U$ -homologous to 0

Defn

Given 2 paths  $\gamma + \eta$ .

If  $\text{Ind}_\gamma(z) = \text{Ind}_{\gamma+\eta}(z) \quad \forall z \in C \setminus U$

Then  $\gamma$  and  $\eta$  are "homologous in  $U$ "

denoted by

$\gamma \sim \eta$

Theorem:  $\forall f \in H(U), \int f = \int f$  is  $\gamma \sim \eta$ .

Proof later

$\gamma$        $\eta$

## Chains

$\gamma_1, \dots, \gamma_n$  curves in  $U$

$k_1, \dots, k_n \in \mathbb{Z}$ .

$$\gamma = \sum_1^n k_i \gamma_i$$

If  $\gamma_i$  is closed  $\forall i$  then  $\gamma$  is said to be a Cycle

Now, 1)  $\gamma^* = \gamma_1^* \cup \gamma_2^* \cup \dots \cup \gamma_n^*$

2)  $f: \gamma^* \longrightarrow \mathbb{C}$

$$\int_{\gamma} f = k_1 \int_{\gamma_1} f + \dots + k_n \int_{\gamma_n} f$$

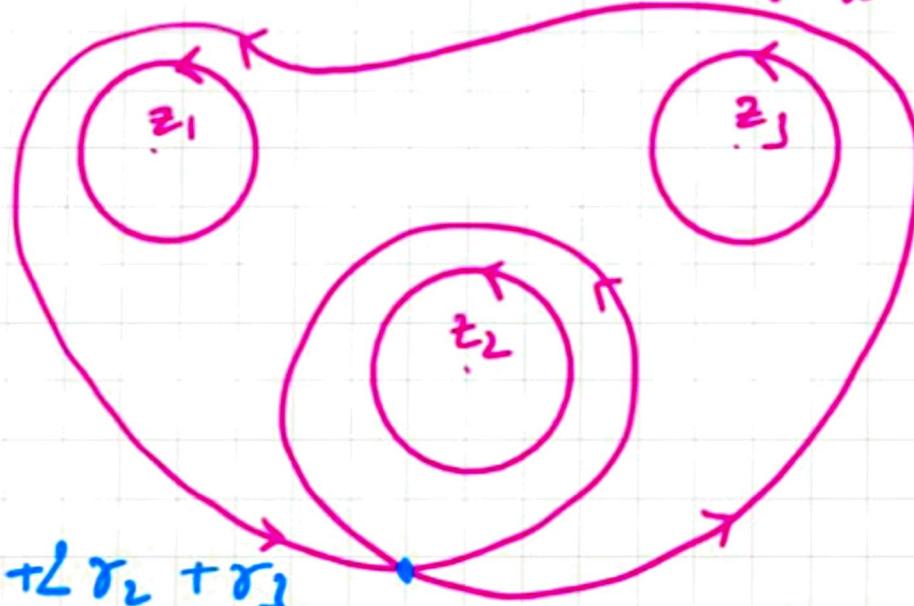

3)  $\gamma$  is a cycle,  $\forall z \in \mathbb{C} \setminus \gamma^*$

$$\text{Ind}_{\gamma}(z) = k_1 \text{Ind}_{\gamma_1}(z) + \dots + k_n \text{Ind}_{\gamma_n}(z)$$

$$\left[ \int_{\gamma} \frac{f(w) dw}{w-z} = \sum k_i \int_{\gamma_i} \frac{f(w) dw}{w-z} \right]$$

Examples  
of homotopy

$$\gamma \sim \gamma_1 + 2\gamma_2 + \gamma_3$$

$$\gamma \sim$$

$$\gamma_1 + 2\gamma_2 + \gamma_3$$

Theorem:-

Let  $\gamma$  be a cycle

$z_1, \dots, z_m \in U$

$\rightarrow D_i = D(z_i, z_i)$

$\rightarrow D_i \cap D_j = \emptyset$

and  $D_i \subseteq U, \gamma_i$

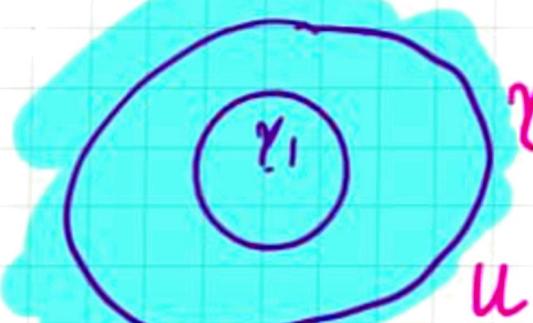

Then,  $\text{Ind}_{\gamma}(z_i) = C(z_i, n)$

$$\gamma \sim$$

$$\sum k_i \gamma_i$$

where

$$k_i = \text{Ind}_{\gamma}(z_i)$$

$$\gamma \sim \gamma_1$$

\* Clearly  $U \subseteq \mathbb{C}$ ,  $\gamma$  is a cycle in  $U$ :  $\{\gamma = \sum_{i=1}^n k_i \gamma_i\}$

$\forall z \in \mathbb{C} \setminus U$ ,  $\text{Ind}_\gamma(z) = 0$

$\Rightarrow \forall z \in U \setminus \gamma^*$  i.e.  $\gamma \tilde{=} 0$

$$\text{Ind}_\gamma(z) f(z) = \frac{1}{2\pi i} \int_{\gamma} \frac{f(w)}{w-z} dw$$

\* Corollary is the above mentioned theorem and hence

Proof:-

$$g: U \times U \rightarrow \mathbb{C}$$

$$g(w, z) = \begin{cases} \frac{f(w) - f(z)}{w-z} & : w \neq z \\ f'(w) & : w = z \end{cases}$$

Step 1 :-  $\forall z \in U$ ,  $t \mapsto \int_U g(w, z) dw$  is holo

Step 2 :-  $V = \{z \in \mathbb{C} \setminus \gamma^* : \text{Ind}_\gamma(z) = 0\}$

$\Rightarrow \mathbb{C} \setminus U \subseteq V \Rightarrow U \cup V = \mathbb{C}$ ,  $z \in U \cap V$

$$\int_U g(w, z) dw = \int_{\gamma} \frac{f(w)}{w-z} dw$$

$$h: \mathbb{C} \rightarrow \mathbb{C}$$

$$h(z) = \begin{cases} \int_U g(w, z) dw & : z \in U \\ \int_{\gamma} \frac{f(w)}{w-z} dw & : z \in V \text{ unbounded} \end{cases}$$

Step 3 :-  $V_M' = \{ z : d(z, \gamma_j^*) \leq M \} \rightarrow \text{bad}.$

$$V_M'' = \{ z : d(z, \gamma_j^*) > M \}$$

$$z \in V_M'', \quad h(z) = \sum_{j=1}^n k_j \int \frac{f(w)}{w-z} \gamma_j$$

$$\Rightarrow |h(z)| \leq \sum_{j=1}^n |k_j| \underbrace{\sup_M |f(w)|}_{M} \cdot \lambda \gamma_j \\ \leq K'$$

$\Rightarrow h(z)$  is constant + since  $V_M'' \neq \emptyset$

$$\boxed{h(z)=0}$$

# Homotopy

- $U \subseteq \mathbb{C}$  open. We say  $\gamma_0, \gamma_1$  are homotopic in  $U$  if there is a continuous map

$$H: [a, b] \times [0, 1] \xrightarrow{\text{cts}} U \ni$$

$$(i) \quad H(t, 0) = \gamma_0(t) \quad \forall t \in [a, b]$$

$$(ii) \quad H(t, 1) = \gamma_1(t) \quad \forall t \in [a, b]$$

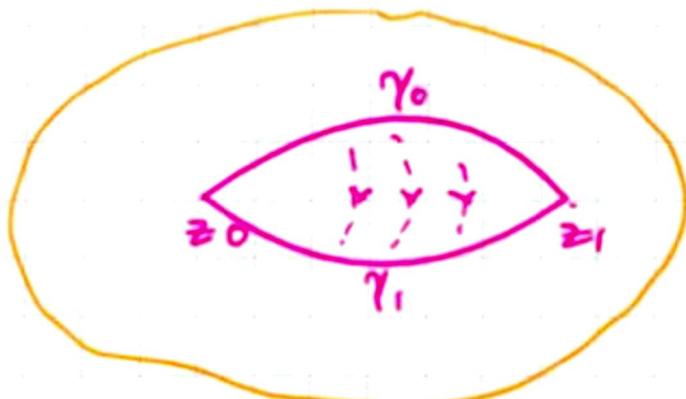

$$(iii) \quad \forall s \in [0, 1]$$

$$H(a, s) = z_0, \quad H(b, s) = z_1 \quad ] \Rightarrow \text{endpoints are fixed.}$$

For any  $s \in [0, 1]$ ,  $\gamma_s(t) = H(t, s)$ ,  $t \in [a, b]$

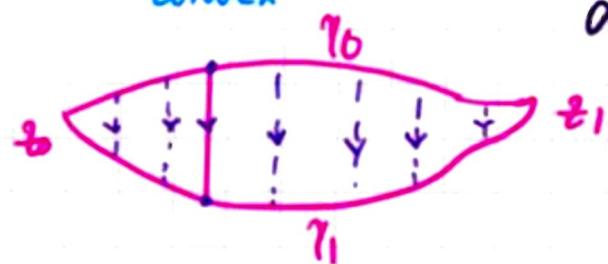

curve at "time"  $s$   
≈ deformation

- We deform  $\gamma_0 \rightarrow \gamma_1$  in time.
- Curve doesn't leave  $U$ .
- $\gamma_s$  need not be a path.

If  $U \subseteq \mathbb{C}$   $\Rightarrow$  Any 2 curves will be homotopic  
 open convex

line segment joining any 2 points  $\in U$ .  
 Push  $\gamma_0$  along that line

Homeomorphism will be :-

$$H(t, s) = (1-s)\gamma_0(t) + s\gamma_1(t)$$

Same holds if  $U$  is star-like Region

Example 2  $\div U: \mathbb{C} \setminus R_x$ .  $\gamma_0, \gamma_1 \rightarrow$  curves. Here also any 2 curves will be homotopic to each other

$$\gamma_0(t) = |\gamma_0(t)| e^{i \arg_\alpha(\gamma_0(t))}$$

$\arg_\alpha$  &  $\log_\alpha$  exists in  $\mathbb{C} \setminus R_x$

$$\gamma_1(t) = |\gamma_1(t)| e^{i \arg_\alpha(\gamma_1(t))}$$

$$i((1-s)\arg_\alpha(\gamma_0(t)))$$

$$H(s, t) = ((1-s)|\gamma_0(t)| + s|\gamma_1(t)|) \cdot e^{i \arg_\alpha(\gamma_0(t))}$$

✓ Verify

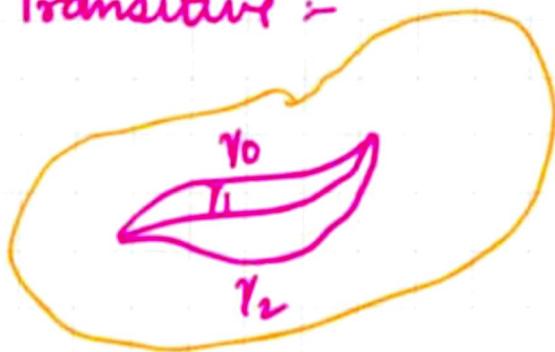

## Some Algebra

\* Homotopy is equivalence relation.

+ Reflexive :- ✓

+ Symmetric :-  $\tilde{H}(t, s) = H(t, 1-s)$

+ Transitive :-

$$H(t, 2s) : 0 \leq s \leq \frac{1}{2}$$

$$\gamma_0 \rightarrow \gamma_1 \quad (\text{first } \frac{1}{2}) \text{ and}$$

$$\gamma_1 \rightarrow \gamma_2 \quad (\text{second half})$$

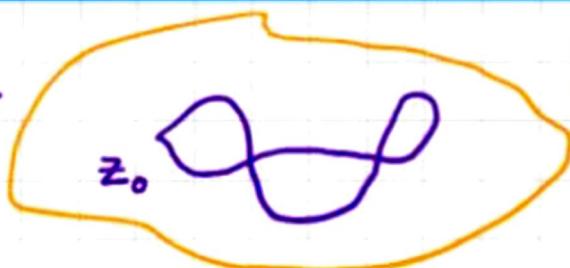

$$H(t, s) = \begin{cases} H_1(t, 2s) & : 0 \leq s \leq \frac{1}{2} \\ H_2(t, 2s-1) & : \text{otherwise} \end{cases}$$

## Path Homotopy

Suppose.  $\gamma_0$  &  $\gamma_1$  are paths.

Convention:- If  $\gamma_0$  &  $\gamma_1$  are paths & homotopic in  $U$   
then  $\gamma_s$  is also a path  $\forall s \in [0, 1]$

For closed Path :-

$$\gamma_0(a) = \gamma_0(b) = z_0$$

$$\gamma_1(t) = z_0$$

\* Every closed path in a convex set is homotopic to its end point ( $\gamma(a) = z_0$ ). We also say  $\gamma$  is Null homotopic in  $U$ .

Let  $U \subseteq \mathbb{C}$ . If every closed path is open connected null homotopic then  $U$  is simply connected.

Examples:-

① Open convex subsets of  $\mathbb{C}$

②  $\mathbb{C} \setminus R_\alpha \forall \alpha \in \mathbb{R}$

\*  $U = \mathbb{C} \setminus \{0\}$  Not simply connected

$$\gamma_0(t) = e^{it}, 0 \leq t < 2\pi \times$$

Consider  $z \in \mathbb{C} \setminus U$  while  $\gamma_0 + \gamma_1$  are closed path in  $U$ , homotopic. Let  $(t, s) \mapsto H(s, t) - z \neq 0$   
 $\Rightarrow \theta$  (its arg exists)

Fix  $s \in [0, 1]$ ,  $\theta_s(t) = \theta(t, s) \rightarrow$  always cons

$$|\gamma_s(t) - z| = |\gamma_s(t) - z| e^{i\theta_s(t)}$$

$$\text{Ind}_{\gamma_s}(z) = \frac{\theta_s(b) - \theta_s(a)}{2\pi} = \frac{\theta(b, s) - \theta(a, s)}{2\pi}$$

$$= f_n \text{ of } s \in \mathbb{Z}$$

given  $z = \text{fixed}$ ,

$$S \xrightarrow{\text{Ind}_{\gamma_s}(z)} \text{Ind}_{\gamma_s}(z) \text{ is a continuous function}$$
$$\Rightarrow \text{Ind}_{\gamma_0}(z) = \text{Ind}_{\gamma_1}(z)$$

Same holds for closed curves :-

$$\forall z \in C \setminus U, \text{Ind}_{\gamma_0}(z) = \text{Ind}_{\gamma_1}(z)$$

$\Rightarrow \gamma_0$  and  $\gamma_1$  are homologous

$$\Rightarrow \forall f \in H(U), \int_{\gamma_0} f = \int_{\gamma_1} f$$

$\gamma_0$  &  $\gamma_1$  are homotopic  $\Rightarrow$  homologous

# Homotopy Version of Cauchys Theorem

$U \subseteq \mathbb{C}$ ,  $\gamma$  is closed path which is null homotopic in  $U$ .  $\forall f \in H(U)$ ,

$$\int_{\gamma} f = \int_{\text{const path } (z_0)} f = 0$$

$\Rightarrow \gamma \sim 0$   
Because const path

i.e if  $U$  is simply connected, then  $\forall \gamma \rightarrow$  closed path in  $U$ ,  $\forall f \in H(U)$ ,  $\int_{\gamma} f = 0$  as all  $\gamma \rightarrow$  null homotopic

## Conclusions

- $\forall f \in H(U) \xrightarrow{\text{simply connected}} \exists F \in H(U) \xrightarrow{\text{Assignment}} f' = f$ . In fact for  $z_0 \in U$ ,  $f(z) = \int_{z_0}^z f + z \in U$
- Let  $f: U \rightarrow \mathbb{C} \setminus \{0\}$  analytic function  $\Rightarrow \frac{f'}{f} \in H(U)$  (Algebra of holomorphic functions)

$$h(z) = \int \frac{f'}{f} dz \quad \forall z \in U \quad [using \text{ } (1)]$$

$$\Rightarrow \forall z \in U, h'(z) = \frac{f'(z)}{f(z)} \Rightarrow \phi = e^{-h} f, f \in H(U)$$

$$\phi' = -h'e^{-h}f + e^{-h}f' = 0$$

$\Rightarrow \phi$  is constant ( $U$  is connected)

$$\Rightarrow \phi(z) = f(z_0)$$

$$\text{hence, (let } w_0 \in C \ni f(z_0) = e^{w_0})$$

$$\text{Then, } -h(z) = w_0 + h(z)$$

$$e^{-h(z)} f(z) = f(z_0) \Rightarrow f(z) = e^{w_0}$$

an analytic logarithm namely,  $\frac{z}{z}$

$$z \mapsto w_0 + \int_{z_0}^z \frac{f'}{f}$$

Note :- The above depends on  $z_0$  &  $w_0$ . But any other choice will differ by  $2\pi i$

$U \subseteq \mathbb{C}$ , simply connected,  $0 \notin U$ .

$$f(z) = z, \forall z \in U$$

$\Rightarrow f$  vanishes everywhere

$$\Rightarrow \text{Fix } z_0 \in U, z \mapsto w_0 + \int_{z_0}^z \frac{dw}{w} \text{ is analytic log of }$$

$f(z) = z$ . Then  $\exists$  a branch of  $\log$  on  $U$

$$\left\{ \log z = \log z_0 + \int_{z_0}^z \frac{dt}{t} \right\}$$

Corollary:-

$\forall f \in H(U)$  if  $f$  is  $0$  free.  $\forall n \in \mathbb{N}$   $f$  has an analytic  $n^{th}$  root

$$\text{i.e. } \exists F \in H(U) \ni F^n = f$$

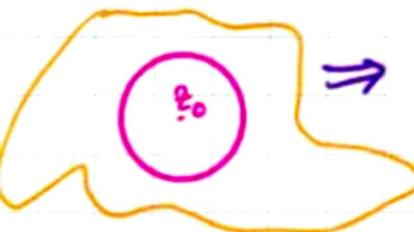

$Tf?$

## Zeros of Analytic functions

$U \subseteq \mathbb{C}$  open connected,  $f \in H(U)$

$$Z(f) = \{z \in U : f(z) = 0\} \subseteq U$$

Let  $z_0 \in Z(f) \subseteq U$  &  $\exists R > 0 \ni D(z_0; R) \subseteq U$

$$\Rightarrow \forall z \in D(z_0; R) \quad f(z) = \sum_0^{\infty} a_n (z - z_0)^n$$

Assume that all  $a_m \neq 0$ . Let  $m > 0$  be the least index

$$\Rightarrow a_m \neq 0$$

$$f(z) = \sum_{i=m}^{\infty} a_i (z - z_0)^i$$

Let

$$g(z) = \begin{cases} \frac{f(z)}{(z - z_0)^m} & : z \neq z_0 \\ a_m & : z = z_0 \end{cases}$$

$\Rightarrow g$  is holo  $U \setminus \{z_0\} \Rightarrow g \in H(U)$  (Morera's Theorem)

Theorem :- Let  $U \subseteq \mathbb{C}$ ,  $f: U \xrightarrow{\text{holo}} \mathbb{C}$ . Suppose  $Z(f)$  has a clusterpoint in  $U$ . Then  $f$  vanishes i.e.  $f = 0$  ✓

Proof :- Let  $z_0$  be a c.p. of  $Z(f)$ . Clearly,  $f$  being cts at  $z_0 \Rightarrow f(z_0) = 0 \Rightarrow z_0 \in Z(f)$ .

lets expand

$f$  into power series around  $z_0$ . (Analytic to your)

$$f(z) = \sum a_n (z - z_0)^n, \forall z \in D(z_0, r) \subseteq U$$

claim :-  $a_n = 0 \forall n > 0$ .

If not let  $m = \text{least } \mathbb{Z}^+ \ni a_m \neq 0$ . Then

$$f(z) = (z - z_0)^m \frac{g(z)}{g(z_0)} \quad [g(z_0) = 0]$$

[Before Analysis]

Since  $g$  is cts,

$$\exists \epsilon < r \ni g(z) \neq 0 \forall z \in D(z_0, \epsilon)$$

$$\Rightarrow \nexists \text{ a seq } \{z_n\} \ni z_n \rightarrow z_0 \quad f(z_n) \rightarrow f(z_0)$$

i.e.  $z_0$  is not a cluster point

i.e.  $z_0$  is not a cluster point  $\Leftrightarrow$

Let  $A = \{ z \in U : z = \text{cluster point of } z(f) \}$ . Since  $z_0 \in A$ ,  $A \neq \emptyset$ . If  $z \in A$ , by above argument,

$$\forall z \in D(z, \varepsilon), f(z) = D \Rightarrow B(z, \varepsilon) \subseteq A$$

① Hence,  $A$  is open.

② Let  $z = l.p.$  of  $A$ .  $\exists \text{sgn } z_n \text{ in } A \ni z_n \xrightarrow[n \in \mathbb{N}]{\leftarrow} z$ .  
If  $z_n = z$  for some  $n$ .

$z \in A$ . Else if  $z_n \neq z$   
 $\forall n, \forall z \in A$

then,  $z$  is a cluster point of  $\{z_n : n \in \mathbb{N}\}$

$$\Rightarrow z \text{ is c.p. of } z(f) \Rightarrow z \in A$$

Hence,  $A$  is closed.

Since,  $U$  is connected  $\Rightarrow A = U$  or  $A = \emptyset$ .

### Identity Theorem

$U \subseteq \mathbb{C}$ , connected,

$$f, g : U \xrightarrow{\text{holo}} \mathbb{C}, S = \{z \in U : f(z) = g(z)\}$$

If  $S$  has a limit point then  $= z(f-g)$

\*  $U \subseteq \mathbb{C} \rightarrow \text{open + connected} \Leftrightarrow U = \text{Region}$   
 $U = \mathbb{C} \setminus \{0\}, f(z) = \sin \frac{1}{z} : z \neq 0$

$$\left\{ \frac{1}{n\pi} : n \in \mathbb{Z} \right\} \subseteq z(f)$$

\* (limit points should be considered inside  $U$ )

Theorem- If  $f \neq 0$  in  $U$ ,  $f : U \rightarrow \mathbb{C}$ . then the set  $z(f)$  is countable

proof.  $U \subseteq \mathbb{C}$ ,  $f \in H(U)$ .  $Z(f)$  doesn't have a limit reg point in  $U$ .

$$U = \bigcup_{n=1}^{\infty} K_n. \quad K_n \subseteq U \text{ and compact}$$

$$K_n \subseteq K_{n+1} \forall n.$$

If  $Z(f) \cap K_n = \infty$ , being  $\infty$  subset of a compact set, it has a limit point in  $K_n$ .  
 $\Rightarrow l.p. \text{ in } U$

That limit point is in  $K_n \subseteq U \Rightarrow \Leftarrow$   
 $\Rightarrow \forall n > N, Z(f) \cap K_n \text{ is finite}$

$$Z(f) = \bigcup_{n=1}^{\infty} (Z(f) \cap K_n)$$

$\Rightarrow Z(f)$  is countable

# Assume  $Z(f)$  doesn't have a l.p. in  $U$ . Let  $z_0 \in Z(f)$

$$g(z) = \begin{cases} \frac{f(z)}{(z-z_0)^n} & : z \neq z_0 \\ a_m & : z = z_0 \end{cases}$$

$$f(z) = (z-z_0)^m g(z), \quad \forall z \in U, g(z_0) \neq 0$$

$\downarrow$  polynomial  $\downarrow$

Exercise:- Show,  $m \in \mathbb{N}$ ,  $g$  are!, take  $m, g_1, \dots$

# Maximum Modulus Principle

$U \subseteq \mathbb{C}$ ,  $f \in H(U)$ . Let  $r > 0 \Rightarrow \overline{D(z_0, r)} \subseteq U$ .

Assume  $|f(z_0 + re^{it})| \leq |f(z_0)| + t \in [0, 2\pi]$

$$\frac{1}{2\pi} \int |f(z_0 + re^{it})|^2 = \sum_{n=0}^{\infty} |a_n|^2 r^{2n} \quad [\text{Proved in assignments}]$$

$$\Rightarrow |f(z_0)|^2 \geq \sum_{n=0}^{\infty} |a_n|^2 r^{2n}$$

$$\Rightarrow |a_0|^2 \geq \sum_{n=0}^{\infty} |a_n|^2 r^{2n} \geq |a_0|^2$$

$$\Rightarrow a_1 = a_2 = \dots = 0 \quad \forall n \geq 1$$

$f$  is constant on  $D(z_0; r) \subseteq \overline{D(z_0; r)} \subseteq U$   
 $\downarrow$   
 has a l.p. in  $U$

from Id theorem,  $f$  is a constant

Hence,  $\underset{\Rightarrow}{\text{Value of } f \text{ at centre dominates value at boundary}}$   
 $f$  is a constant.

- \*  $|f(z_0)| \leq \max_{0 \leq t \leq 2\pi} |f(z_0 + re^{it})|$  and equality when

= Max. Modulus

Theorem:-  $U \subseteq \mathbb{C}$  region, bounded. let  $f \in H(U)$ . Principle

Then i)  $f$  = constant OR

ii)  $f$  doesn't have a local maxima in  $U$

## Minimum Modulus Principle

- \* let  $U \subseteq \mathbb{C}$ ,  $f \in H(U)$ . let  $z_0 \in U$  &  $r > 0$  be  
region such that  $\overline{D(z_0; r)} \subseteq U$  and  $f$  vanishes  
nowhere in  $\overline{D(z_0; r)}$  then,  $|f(z_0)| \geq \min_{t \in [0, 2\pi]} |f(z_0 + re^{it})|$
- \* let  $\bar{U} \subseteq \mathbb{C}$ ,  $f \in H(\bar{U})$ .  $f \neq 0 \quad \forall z \in \bar{U}$ , then  
 $\min_{\bar{U}} f = \min_{\partial U} f$ .
- \* If a local minima exists, then  $f=0$   
at that point, else  $f = \text{constant}$

## Corollary :- Maximum Modulus Principle

\*  $U \subseteq \mathbb{C}$  .  $f \in H(U)$  . Then if  $f$  has a local max.

$f$  is constant

$$|f(z_0)| \geq |f(z)| \quad \forall z \in D \\ \Rightarrow \checkmark$$

\* Let  $U$  be bdd.  $f: \bar{U} \xrightarrow{\text{cts}} \mathbb{C}$  . Assume  $f \in H(U)$

$$\max_{\bar{U}} |f| = \max_{\partial U} |f|$$

proof: If  $f$  is constant  $\checkmark$ .  
else,  $|f|_{\max}$  can't lie inside

## Open Mapping Theorem

Theorem :-  $f: U \xrightarrow{\text{holo}} \mathbb{C}$  such that  $f'(z) \neq 0$  for some  $z \in U$ . Then  $\exists V \subseteq U$   $\ni z \in V$  and  $f$  is 1-1, mto  $V$ ,  $f^{-1}$  is holo in  $f(V)$ .  $V$  is open

proof :- Consider  $f$  as a function in  $\mathbb{R}^2$

$$f = u_x + i u_y \Rightarrow \det(\nabla f) = |f'(z)|$$

$$= v_x - i v_y \quad f'(z) \neq 0 \Rightarrow \det(\nabla f) \neq 0$$

i.e.  $\nabla f$  is non singular. Using IMT

$\exists V \subseteq U$  and  $W \subseteq \mathbb{C}$   $\ni$

- i)  $f$  is one-one on  $V$   
ii)  $f^{-1}: W \rightarrow V$  is one-one one

Now observe  $g: W \rightarrow W$

$$g = f(f^{-1}(z)) = z$$

Since,  $f \in H(V)$ .

$f^{-1}$  is onto

and  $f(f^{-1}(z)) \neq 0$  (By INT again)

hence

$f^{-1} \in H(W)$ .

Hence Proved.

Theorem :- Let  $U \subseteq \mathbb{C}$ ,  $f \neq \text{constant}$ , if  $f'(z_0) = 0$  at  $z_0 \in U$ , then  $\exists V \subseteq U$ ,  $z_0 \in V$ ,  $\exists p > 0$ ,  $m > 1$ ,  $m \in \mathbb{N}$  and an onto holomorphic function  $\psi: V \rightarrow D(0, p)$  such that

i)  $\forall z \in V$ ,  $f(z) = f(z_0) + (\psi(z))^m$

ii)  $\psi(z_0) = 0$       iii)  $\psi$  vanishes nowhere in  $V$

iv)  $\psi$  is  $m$  to 1 on  $V \setminus \{z_0\}$

### Analysis

Clearly,

If  $f'(z_0) = 0$ ,  $f$  is open mapping from an open neighbourhood of  $z_0$ . Else,  
 $D(f(z_0); p^m) = f(V) \subseteq f(U)$ , if  $U$  is connected and  $f$  is non-constant.

Hence,  $\forall$  non-constant  $f \in H(U)$ ,  $f(z_0)$  is an interior point of  $f(U)$ .  $\Rightarrow f(U) = \text{open}$

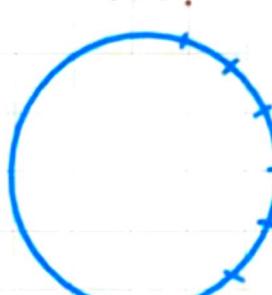

Theorem :- Let  $U$  be a region,  $f \in H(U)$ . Then,  
either  $f(U) = \text{open}$  or a point.

↓ Observe, Max Modulus principle is a special  
Case of OMT.

## Some takeaways from Identity Theorem

1.  $f \equiv 0$  or all zeros are isolated points
  2.  $Z(f) \cap K = \text{finite} \nvdash K \subset U$   
compact
  3. In particular.  $\overline{D(z_0; r)} \subseteq U \Rightarrow f \text{ has finitely many zeros in } D(z_0; r)$
- \* If  $\overline{D(z_0; r)} \subseteq U \Rightarrow \exists R > r \ni D(z_0; R) \subseteq U$ .  
 Then  $Z(f) \cap D(z_0; r) = \text{finite}$   
 i.e  
 Assumption of  $U$ -connected can be dropped.
- \*  $U \subseteq \mathbb{C}$ ,  $\left\{f_n\right\}_{n=1}^{\infty} \subseteq H(U)$ ,  $f_n \xrightarrow{a.u.} f$ , suppose each  $f_n$  has exactly  $k$  zeros in  $\overline{D(z_0; r)}$ .
- Q** Does  $f$  have  $k$  zeros in  $\overline{D(z_0; r)}$   
 Ans **No!**,  
 eg:-  $f_n(z) = \frac{z}{n} \cdot \mathbb{D}$

- Q** Does  $f$  has AT LEAST!  $k$  zeros in  $D(z_0; r)$ ?
- Ans** **No!**  $\mathbb{D}, k \in \mathbb{N}$
- 
- $1 \leq r < k, \beta \in S^1, l = k - r$   
 $a_i \neq a_j, i \neq j$
- Choose a seq<sup>n</sup>  $\{\beta_n\}_{n=1}^{\infty} \subseteq \mathbb{D}$

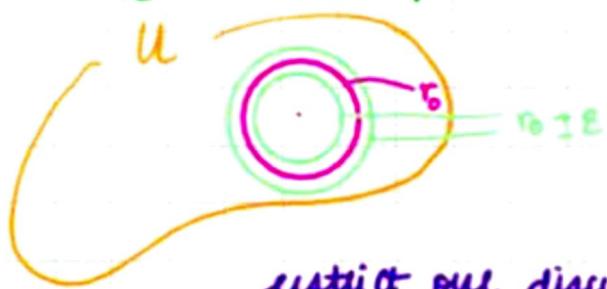

$\Rightarrow \beta_n \rightarrow \beta$ . Consider  $f_n(z) = (z - \beta_n)^l (z - \alpha_1)(z - \alpha_2) \cdots (z - \alpha_k)$

Check,  $f_n(z) \rightarrow f(z)$ , uniformly

But no. of zeros will drop down!

→ change assumptions ~

proof:- Let  $\alpha_1, \dots, \alpha_k$  are precisely all distinct zeros of  $f$  in  $D(z_0; r)$

[we can get  $R > 0 \ni \overline{D(z_0; R)} \subset U$  &  $f$  has exactly  $k$  zeros  $\alpha_1, \dots, \alpha_k$  in  $\overline{D(z_0; R)}$ ]

restrict our discussion to  $\overline{D(z_0; R)}$

$$f(z) = (z - \alpha_1)^{m_1} g_1(z) = (z - \alpha_1)^{m_1} (z - \alpha_2)^{m_2} g_2(z) \cdots$$

$$f(z) = (z - \alpha_1)^{m_1} (z - \alpha_2)^{m_2} \cdots (z - \alpha_k)^{m_k} g(z) : g(z) \in H(U) \\ g(z) \neq 0 \forall z \in \{\alpha_1, \dots, \alpha_k\}$$

Observe  $g$  is zero-free in  $\overline{D(z_0; R)}$

$$\frac{f'(z)}{f(z)} = \frac{m_1}{z - \alpha_1} + \cdots + \frac{m_k}{z - \alpha_k} + \frac{g'(z)}{g(z)}$$

$$\frac{1}{2\pi i} \int_{C(z_0; r)} \frac{f'(z)}{f(z)} dz = \sum m_i + \frac{1}{2\pi i} \int_{C(z_0; r)} \frac{g'}{g}$$

$$= \sum m_i$$

[ $\hookrightarrow g \in H(D(z_0; r))$   
 $\Rightarrow \text{CIF} \Rightarrow \int = 0$ ]

Theorem :-  $\bigcup_{n \in \mathbb{N}} \{f_n\} \subset H(U)$ ,  $f_n \xrightarrow{q.u} f$ . Assume  $f$  doesn't have any roots on  $|z - z_0| = r \Rightarrow \exists N \in \mathbb{N}$   $\forall n \geq N$ ,  $f_n$  and  $f$  have same no. zeros in  $D(z_0, r)$

Proof :-

$$S = \{z \in U \mid |z - z_0| = r\} \text{ . As } f \text{ doesn't vanish anywhere on } S$$

$$\Rightarrow \exists M > 0 \ni \forall w \in S, |f(w)| \geq M$$

$$\Rightarrow \exists N \in \mathbb{N} \ni \forall n \geq N, |f_n(w) - f(w)| \leq \frac{M}{2} \quad \forall w \in S \quad \text{--- (1)}$$

$$\Rightarrow f_n(w) \neq 0 \quad \forall n \geq N$$

Now, To show :-

$$\left| \frac{1}{2\pi i} \int_{C(z_0, r)} \frac{f'_n}{f_n} \right| \longrightarrow \left| \frac{1}{2\pi i} \int_{C(z_0, r)} \frac{f'}{f} \right|$$

[Using (1)]

sequence of  $\mathbb{Z}$  converging to another integer

$$= \left| \int_{C(z_0, r)} \left( \frac{f'_n}{f_n} - \frac{f'}{f} \right) \right|$$

$$\leq \frac{4\pi r}{M^2} (M_1 + M_2) \epsilon$$

$$\text{Let } \epsilon' = \frac{\epsilon M^2}{(M_1 + M_2) 4\pi r^2}$$

$\Rightarrow \int \frac{f'_n}{f_n}$  converges uniformly

$\Rightarrow$  a seq<sup>n</sup> of  $\mathbb{Z}$  converges

Constant hence Proved

Observe -  $\left| \frac{f'_n}{f_n} - \frac{f'}{f} \right| = \left| \frac{f'_n f - f' f_n}{f_n f} \right|$

$$\leq \frac{2}{M^2} |f'_n f - f' f_n| \quad \text{[using (1)]}$$

$$\leq \frac{2}{M^2} (|f'_n f| + |f' f_n|)$$

$$= \frac{2}{M^2} (|f| |f_n - f'| + |f| |f_n - f|)$$

$$M_1 = \sup |f|, M_2 = \sup |f'|$$

$$\leq \frac{2}{M^2} (M_1 + M_2) \epsilon \quad \forall n \geq N$$

( $f'$  also converges uniformly)

Corollary:- U-region,  $\{f_n\} \subset H(U)$ ,  $f_n \xrightarrow{a.u} f$ . Assume that, for  $\infty$ -many  $n$ ,  $f_n$  doesn't have a zero. Then  $f=0$  or  $f$  doesn't have a zero.

proof:-

Assume  $f \neq 0$ , let  $f(z_0) = D$ ,  $z_0 \in U$ .

$\exists R > 0 \ni D(z_0; R) \subseteq U \wedge f(z) \neq 0 \forall z \in D(z_0; R)$

Consider  $0 < r < R$ ,

$$\overline{D(z_0; r)} \subseteq U,$$

$f_n \neq 0 \forall n > N$ , no zeros in disk

using Hurwitz theorem,  $f$  has no zeros

Hence,  $\cancel{f=0}$  as  $\exists R > 0 \ni \dots$

Cor 2:- Let  $U$ ,  $\{f_n\} \subset H(U)$ ,  $f_n \xrightarrow{a.u} f$ . Assume all  $f_n$  are injective beyond a stage.

Then,  $f$  is constant, or  $f$  is one-one.

proof:- Assume  $f$  is not constant.

Pick  $z_0 \in U$ .

Consider,  $g_n = f_n - f_n(z_0)$ ,  $g = f - f(z_0)$

Clearly,  $g_n \xrightarrow{a.u} g$  in  $U$  and hence in  $H(U)$

Consider  $U\{z_0\}$ , connected  $\vee$ .

Note,  $g_n$  doesn't have a zero on  $U\{z_0\}$

$\Rightarrow g_n \geq 0$  or  $g_n$  has no zero  $\forall n > N$

Hence proved

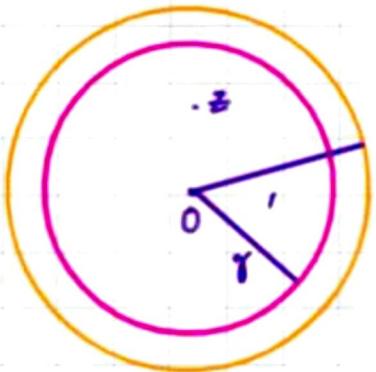

To use  
Hurwitz  
theorem on  
 $U\{z_0\}$ , all  
analyzing  
zeros  
become  
easy

$D = D(0;1)$ ,  $f \in H(D) : f: D \rightarrow D$ ,  $f(0) = 0$ .

Consider,  $g(z) = \begin{cases} \frac{f(z)}{z} & : z \neq 0 \\ f'(0) & : z = 0 \end{cases}$

$\lim_{z \rightarrow 0} g(z) = f'(0) \Rightarrow g$  is its  $\rightarrow g \in H(D)$ .

Now, let  $0 < r < 1$ ,  $|z| < r$ .

Using Maximum Modulus principle,

$$|g(z)| \leq \max_{|w|=r} \frac{|f(w)|}{r} \leq \frac{1}{r}$$

Let  $\frac{1}{r} \rightarrow 1$   
 $\Rightarrow |g(z)| \leq 1$

Hence, i)  $|f(z)| \leq |z|, \forall z \in D$

ii)  $|f'(0)| = |g(0)| \leq 1$

iii) If equality holds in (i) or (ii) for some  $z \neq 0$ ,

Then,  $\exists \lambda \in S^1 = \{z \in \mathbb{C} : |z|=1\}$   
and  $f(z) = \lambda z \quad \forall z \in D$

## SCHWARZ LEMMA

# Aut(D)

examples:-

1.  $f_\lambda(z) = \lambda z$ , where  $|\lambda| = 1$

2. Fix  $w \in D$ , Define,  $\varphi_w(z) = \frac{w-z}{1-\bar{w}z}$ ,  $\forall z \in D$

- + self-inverse
- + holomorphic in  $C \setminus \{\frac{1}{\bar{w}}\}$
- +  $\varphi_w(\partial D) = \partial D$  and
- +  $\varphi_w(D) = D$

PROBLEM :-  $f: D \rightarrow D$ ,  $\alpha, \beta \in D$ ,  $f \in H(D)$

How large can  $|f'(\alpha)|$  be, given  $f(\alpha) = \beta$ ?

$\Rightarrow (\varphi_\beta \circ f \circ \varphi_\alpha)(0) = 0$ . using Schwarz lemma,

$$\left\| g \right\|_{\mathcal{D}} \quad |g'(0)| \leq 1 \Rightarrow$$

$$|\varphi_\beta'(\beta) f'(\alpha) \varphi_\alpha'(0)| \leq 1$$

$$\left[ \begin{aligned} \varphi'_w(z) &= \frac{(1-\bar{w}z)(-1) + (w-z)\bar{w}}{(1-\bar{w}z)^2} \Rightarrow |\varphi'_w(0)| = |w|^2 - 1 \\ &\quad |\varphi'_w(w)| = \frac{1}{|w|^2 - 1} \end{aligned} \right]$$

thus,

$$|f'(\alpha)| \leq \frac{|w|^2 - 1}{|\alpha|^2 - 1}$$

Remark :-

- ① Maximizers are all Rational functions
- ② " " " 1-1, onto mapping

K Theorem :- All Analytic Automorphisms are of form

$$\Psi_A f() \Psi_B$$

Proof :-

Automorphism  $\longrightarrow$  bijective holo + inverse also holo

$$\Rightarrow f \in \text{Aut}(\mathbb{D}) \Rightarrow \exists! w \in \mathbb{D} \ni f(w) = 0$$

$$\text{Let } g = f^{-1}$$

$$g'(f(z)) f'(z) = 1 \quad \forall z \in \mathbb{D}, \quad \Rightarrow \begin{cases} g'(f(z)) = z \\ g'(f(w)) f'(w) = 1 \end{cases}$$

$$\text{hence, } g'(0) f'(w) = 1 \Rightarrow |g'(0) f'(w)| = 1 \quad \text{--- ①}$$

$$\text{Also, } f(w) = 0 \Rightarrow \text{using Schwarz Lemma, } |f'(w)| \leq \frac{1}{1-|w|^2} \quad \text{--- ②}$$

$$g: \mathbb{D} \longrightarrow \mathbb{D}, \text{ holo } g(0) = w, \quad g(w) = 0$$

using Schwarz Lemma

$$|g'(0)| \leq 1-|w|^2$$

$$\text{insuring in ①, } |f'(w)| \geq \frac{1}{1-|w|^2}$$

using ②, equality holds

$$\Rightarrow g'(0) = 1-|w|^2 \text{ and } |f'(w)| = \frac{1}{1-|w|^2}$$

hence,  $f$  is a maximizer  $\Rightarrow \exists \lambda, |\lambda|=1 \ni$

$$f(z) = \varphi_0(\lambda \varphi_w(z)) \quad \text{--- } *$$

using  $\varphi_0(z) = -z \Rightarrow f(z) = -\lambda \varphi_w(z), \lambda \rightarrow -\lambda$

$\Rightarrow$

$$f(z) = \lambda \varphi_w(z)$$

Hence proved

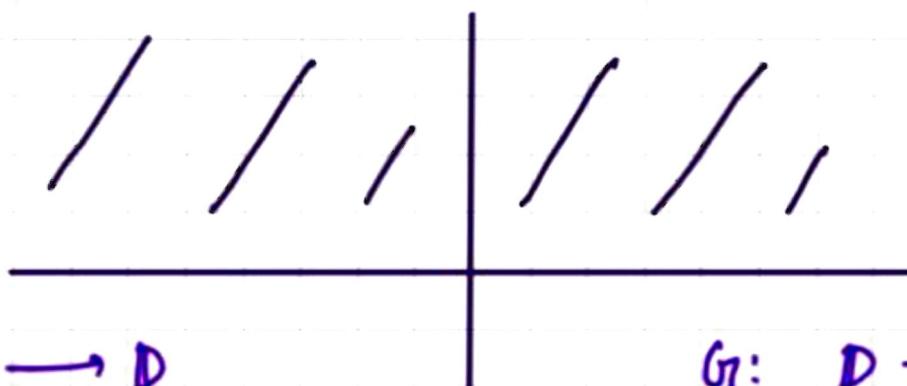

Corollary :-  $f \in \text{Aut}(\mathbb{D}), f(0)=0 \Rightarrow \exists |\lambda|=1 \ni$

$$f(z) = \lambda z$$

origin fixing automorphisms are all ROTATIONS!

## Structural Description

Theorem :-  $\text{Aut}(\mathbb{D}) \cong \text{Aut}(\mathbb{H})$

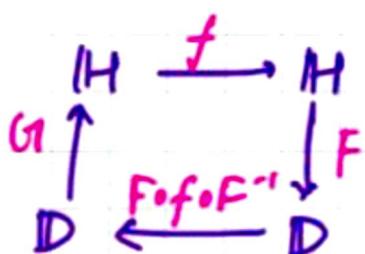

$$F: \mathbb{H} \rightarrow \mathbb{D}$$

$$G: \mathbb{D} \rightarrow \mathbb{H}$$

$$f(z) = \frac{i-z}{i+z}$$

$$G(z) = i \cdot \frac{1-w}{1+w}$$

Clearly,  $f(i)=0, g(0)=i$

$f \in \text{Aut}(\mathbb{H})$

$\Rightarrow f \circ g \circ f^{-1} \cong \text{Aut}(\mathbb{D})$

Hence,  $\text{dut}(\text{IH}) \cong \text{dut}(\text{ID})$

Definition : Möbius Transformation

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} z = \frac{az + b}{cz + d}$$
$$\equiv M$$

$$Mz = f_M(z)$$

Observe, this is a group action from  $SL_2(\mathbb{R})$  on  $\text{IH}$

Hence,

$$f_{M_1 M_2} = f_{M_1} \cdot f_{M_2} \Rightarrow (f_M)^{-1} = f_{M^{-1}}$$

\* each  $(2 \times 2)$  matrix gives rise to an automorphism of upper half plane

Theorem :- Every auto in  $\text{IH}$  is of form  $M_z$

Proof :-  $f\left(\begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix} z\right) = f\left(\frac{\cos\theta z - \sin\theta}{\sin\theta z + \cos\theta}\right)$

$$= M_\theta$$
$$= \frac{i - \frac{z \cos\theta - \sin\theta}{z \sin\theta + \cos\theta}}{i + \frac{z \cos\theta - \sin\theta}{z \sin\theta + \cos\theta}} = \frac{-z(\cos\theta - i \sin\theta) + (i \cos\theta + \sin\theta)}{z(\cos\theta + i \sin\theta) + (i \cos\theta - \sin\theta)}$$
$$= -\frac{ze^{-i\theta} + ie^{i\theta}}{ze^{i\theta} + ie^{i\theta}} = \frac{e^{-i\theta}}{e^{i\theta}(i+z)} = e^{-2i\theta} F(z)$$

$$\text{hence, } f \circ M_\theta = e^{-2i\theta} f(z)$$

hence,

$$f \circ M_\theta \circ f^{-1}(z) = e^{-2i\theta} z$$

Now,  $f \in \text{Aut}(\mathbb{H})$ .

$\exists$  a matrix  $N \in SL_2(\mathbb{R})$  such that  $f(w) = i \in \mathbb{H}$ , From transitivity  
 $f_N(i) = w$  [of group action]

$$(f \circ f_N)(i) = f(w) = i \Rightarrow f \circ f_N \in \text{Aut}(\mathbb{H})$$

Hence,  $f \circ (f \circ f_N) \circ f^{-1} \in \text{Aut}(\mathbb{D})$

$$f \circ (f \circ f_N) \circ f^{-1}(0) = 0 \quad [f^{-1}(0) = i]$$

$\exists \psi \in \mathbb{R} \ni f \circ (f \circ f_N) \circ f^{-1}(z) = e^{i\psi} z$  (Aut( $\mathbb{D}$ ) fixing 0)

choose  $\Theta = -\frac{\psi}{2}$ , we get  $f \circ (f \circ f_N) \circ f^{-1}(z) = e^{-2i\Theta} z$

$$\text{i.e. } f \circ (f \circ f_N) \circ f^{-1} = f \circ N_\Theta \circ f^{-1}$$

$$\text{hence, } f \circ f_N = f_{N_\Theta}$$

i.e.

$$f = f_{N_\Theta} \circ f_{N^{-1}} = f_{N_\Theta N^{-1}}$$

Hence proved

$$\# \quad \begin{array}{ccc} SL_2(\mathbb{R}) & \longrightarrow & \text{Aut } (\mathbb{H}) \\ M & \longrightarrow & f_M \end{array} \xrightarrow{\text{group homomorphisms}}$$

From first Isomorphism theorem, we have

$$\frac{SL_2(\mathbb{R})}{\text{Kernel}} \cong \text{Aut } (\mathbb{H}) \cong \text{Aut } (\mathbb{D})$$

Once we get kernel, we are done!

$$\text{Suppose } M = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \text{ker}$$

$f_M(z) = z \quad \forall z \in \mathbb{H}$ , since  $M$  fixes  $z \quad \forall z \in \mathbb{H}$ ,

$M$  fixes  $i \Rightarrow M$  is orthogonal  $\Rightarrow M = \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}$

for some  $\theta \in \mathbb{R}$

$$\text{Then we have, } \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}(zi) = zi$$

$$\Rightarrow \sin\theta = 0, \cos\theta = \pm 1, M = \begin{pmatrix} \pm 1 & 0 \\ 0 & \pm 1 \end{pmatrix} \text{ if } M \in$$

$$= \pm I_2$$

$$\text{Kernel} = \pm I_2.$$

$$\text{Aut } (\mathbb{D}) \cong \text{Aut } (\mathbb{H}) \cong \frac{SL_2(\mathbb{R})}{\{\pm I_2\}}$$

$$\frac{SL_2(\mathbb{R})}{\{\pm I_2\}} = PSL_2(\mathbb{R})$$

## PROBLEM

7.5

Consider  $g(z) = \overline{f(\bar{z})}$

Clearly,  $g(z) \in H(U)$ .

Let  $S = \{z : g(z) = f(z), z \in U\}$

$T \subseteq S$ . and  $T$  has a l.p  
hence  $S$  has a l.p hence  
+  $U$  is connected

$$f(z) = g(z) \quad \forall z \in U$$

hence,  $f(z) = \overline{f(\bar{z})} \Rightarrow \boxed{\overline{f(z)} = f(\bar{z})}$

- $g \in H(U)$ .  
 1. use Cauchy Riemann  
 or  
 2. Basic defn  
 $\epsilon \in \underline{g(z) - g(z_0)}$   
 $z \rightarrow z_0 \quad z - z_0$

Extension of this

$$U^+ \underset{\text{open}}{\subseteq} H \quad \text{and} \quad I \subseteq \partial U^+$$

$$U^- = \{\bar{z} : z \in \bar{U}\}, \quad U = U^+ \cup U^- \cup I$$

Consider  $f : U^+ \cup I \rightarrow \mathbb{C}$ , continuous

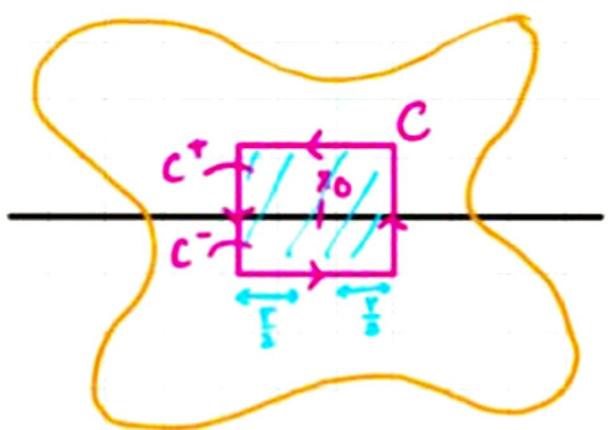

and  $f$  is holo on  $U^+$ . Assume  $f(I) \subset R$

$$\text{Let } F(z) = \begin{cases} f(z) & : z \in U^+ \cup I \\ \overline{f(\bar{z})} & : z \in U^- \end{cases}$$

\* Claim:-  $f$  is holo on  $U^+$  and  $U^-$ .  $F \in H(U)$ .

General proposition:- Let  $f : U \rightarrow \mathbb{C}$ . If  $f$  is holo on  $U^+$ ,  $U^-$ ,  $f$  is d.c. on  $U$  then  $f \in H(U)$ .

Proof:-

Let  $x_0 \in I$ .  $\exists r > 0 \Rightarrow D(x_0, r) \subseteq U$

Define,

$$g(z) = \frac{1}{2\pi i} \int_C \frac{f(w)}{w-z} dw$$

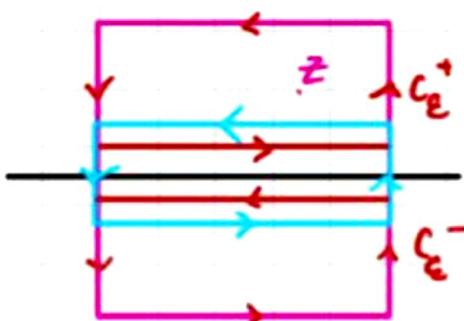

$$\forall z \in (x_0 - \frac{r}{2}, x_0 + \frac{r}{2}) \times (-\frac{r}{2}, \frac{r}{2})$$

$g$  is holomorphic (Because  $f$  is continuous)  
+ use Leibniz theorem

Break  $C \rightarrow 2$  parts,  $C^+$  and  $C^-$

$$\text{if } z \notin [x_0 - \frac{r}{2}, x_0 + \frac{r}{2}] \Rightarrow g(z) = \frac{1}{2\pi i} \int_{C^+} \frac{f(w)dw}{w-z} + \int_{C^-} \frac{f(w)dw}{w-z}$$

$$\Rightarrow z \in C^+ \cup C^-$$

take  $\epsilon < |z| \Rightarrow$  we can form 2 curves  $C_\epsilon^+, C_\epsilon^-$  s.t.  $f \in H(U^+) + H(U^-)$

we can use  $C_1 f \Rightarrow$

$$f(z) = \frac{1}{2\pi i} \int_{C_\epsilon^+} \frac{f(w)dw}{w-z} + \frac{1}{2\pi i} \int_{C_\epsilon^-} \frac{f(w)dw}{w-z}$$

will be 0.

$$\int_{C_\epsilon^+} \frac{f(w)dw}{w-z} = \int_{x_0 - \frac{r}{2}}^{x_0 + \frac{r}{2}} \frac{f(x+i\epsilon)dx}{x+i\epsilon - z} + \int_{x_0 + \frac{r}{2}}^{y_2} \frac{f(x_0 + r_2 + ix)dx}{x_0 + \frac{r}{2} + ix - z} \quad (1)$$

$$- \int_{x_0 - r_2}^{x_0 + \frac{r}{2}} \frac{f(ix_2 + x)dx}{ix_2 + x - z} \quad (3)$$

$$\int_{C_\epsilon^-} \frac{f(w)dw}{w-z} = \int_{y_2}^{r_2} \frac{f(x_0 + r_2 + ix)dx}{x_0 - \frac{r}{2} + ix - z} \quad (2)$$

$$- \int_{\epsilon}^{r_2} \frac{f(x_0 - \frac{r}{2} + ix)dx}{x_0 - \frac{r}{2} + ix - z} \quad (4)$$

Let ① :-

$$\left| \int_{z_0 - \frac{r}{2}}^{z_0 + \frac{r}{2}} \frac{f(x+i\varepsilon) dx}{x+i\varepsilon - z} - \int_{z_0 - \frac{r}{2}}^{z_0 + \frac{r}{2}} \frac{f(x) dx}{x-z} \right| \leq \int_{z_0 - \frac{r}{2}}^{z_0 + \frac{r}{2}} \left| \frac{f(x+i\varepsilon) - f(x)}{x+i\varepsilon - z} \right| dx \quad \text{④}$$

$f$  will be continuous on upper red rectangle (closed) as  $t \in \mathbb{R}$   
from uniform continuity, given  $\theta > 0, \exists \delta > 0$

where, if  $|z - z_0| < \delta$ ,  $|h(z) - h(z_0)| < \theta$

$h(z) = \frac{h(z_0)}{z_0 - z}$ . Now if  $\varepsilon < \delta$  we have

$$\textcircled{4} < \theta \cdot r$$

hence,  $\int_{C_\varepsilon^+} \frac{f(w)}{w-z} dw \xrightarrow{\varepsilon \rightarrow 0} \int_{C^+} \frac{f(w) dw}{w-z}$

likewise  $\int_{C_\varepsilon^-} \frac{f(w)}{w-z} dw \xrightarrow{\varepsilon \rightarrow 0} \int_{C^-} \frac{f(w) dw}{w-z}$   
 $C_\varepsilon^- = 0$  hence  $= 0$

let  $\varepsilon \rightarrow 0$

$$\therefore f(z) = \frac{1}{2\pi i} \left( \int_{C^+} + \int_{C^-} \right)$$

$f(z) = g(z) \forall z \in \text{square except line}$   
 $(z_0 - \frac{r}{2}, z_0 + \frac{r}{2})$

from continuity of  $f$ ,  $\exists a \text{ seq } x_n \rightarrow \text{point of line}$   
 $f$  is ots  $\Rightarrow$  holo at that point also  
 $\Rightarrow f(z) = g(z)$  everywhere in square

\* hence,  $f$  is a special case of this proposition  
 i.e  $f \in H(U)$

## CONFORMALLY EQUIVALENT

$U, V \subseteq \mathbb{C}$

if  $\exists$   $f: U \xrightarrow[\text{onto}]{1-1} V$ , holo  
 we say  $U + V$  are "conformally equi"

examples :-

$$1. D \cong \mathbb{H}$$

$$2. \mathbb{R} \times (\alpha, \alpha+2\pi) \cong \mathbb{C} \setminus \overline{\mathbb{R}}_\alpha \quad [z \rightarrow e^z \text{ map}]$$

Check:-

Non-examples

## Theory

$\subseteq$   
open  $\Omega$

Let  $\mathcal{F}$  be family of functions  $U \rightarrow \mathbb{C}$ .

$\mathcal{F}$  is equicontinuous at  $z_0 \in U$  if

$$\forall \epsilon > 0 \exists \delta > 0 \ni |f(z) - f(z_0)| < \epsilon \quad \forall f \in \mathcal{F}, |z - z_0| < \delta.$$

Proposition :- Let  $\{f_n\} \subseteq C(U) \ni \{f_n\}$  converges pointwise

Denote  $f(z) = \lim_{n \rightarrow \infty} f_n(z), \forall z \in U$ . Assume  $\{f_n : n \in \mathbb{N}\}$

is equicontinuous then:-

- $f$  is continuous
- $f_n$  converges a.u

Proof :-

Let  $K \subseteq U$ ,  $\forall w \in K \exists \delta_w > 0 \ni \forall z \in D(w, \delta_w)$

$$|f_n - f(z_0)| < \epsilon$$

$$\Rightarrow |f_n(z) - f(z_0)| < \epsilon \quad (\text{pointwise convergence})$$

Now,  $K \subseteq U \Rightarrow \exists w_1, \dots, w_s \in K \ni K \subseteq \bigcup_{j=1}^s D(w_j, \delta_{w_j})$

Let  $j = 1, \dots, s$ .  $\exists N_j \in \mathbb{N} \ni \forall n > N_j$

$$|f_n(w_j) - f(w_j)| < \epsilon$$

Let  $N = \max_{1 \leq j \leq s} N_j, \forall n > N \quad |f_n(w_j) - f(w_j)| < \epsilon \quad \forall j = 1, \dots, s$

Pick  $z \in K$ , choose  $j \ni z \in D(w_j, \delta_{w_j})$

$$\Rightarrow |f_n(z) - f(z)| \leq |f_n(z) - f_n(w_j)| + |f_n(w_j) - f(w_j)| + |f(w_j) - f(z)|$$

$\leftarrow 3\epsilon$

$\underbrace{+}$

Lets choose a metric

$$d(f, g) = \sum_{n=1}^{\infty} \frac{\|f-g\|_{K_n}}{2^n \left(1 + \|f-g\|_{K_n}\right)}$$

[ can't use sup as U is not compact ]

\* use all  $K_n$  and bdd Metric

Ex:- ①  $d$  is a metric on  $C(U)$  a.u  
 ②  $\{f_n\}$  converges to  $f$  in  $d \Leftrightarrow f_n \rightarrow f$

\*  $H(U) \subseteq C(U)$   
 $\downarrow$   
 closed subset

$\overbrace{\hspace{10em}}$

Theorem:- Montel's Theorem

Let  $\mathcal{F} \subseteq H(U)$  be u. bdd on each  $K \subseteq U$ , i.e.

$\forall K \subseteq U$ ,  $\exists M_K > 0 \exists \forall z \in K$ ,  $|f(z)| < M_K \forall f \in \mathcal{F}$

Then  $\mathcal{F}$  is compact.

## Defining the metric

Theorem:-  $U \subseteq C$ ,

$\exists \{K_n\} \subseteq U \ni K_n \subseteq K_{n+1}^\circ$  and

$$U = \bigcup_{\text{compact}}^{\infty} K_n$$

proof- let  $K_n = \{z : |z| \leq n\} \cap \{z : d(z, C(U)) > \frac{1}{n}\}$   
 ↓  
 compact as intersection of 2 compact sets

Again! Also,  $K_n \subseteq \{z : |z| \leq n\} \cap \{z : d(C(U), z) > \frac{1}{n+1}\} \subseteq K_{n+1}^\circ$   
 hence  $K_n \subseteq K_{n+1}^\circ$  open

hence,  $U = \bigcup K_n$

$$U = \bigcup K_n^\circ \equiv \boxed{\text{open cover of } U} \Rightarrow \exists G \subseteq U \text{ such that } G \subseteq K_n \text{ for some } n \in \mathbb{N}$$

\* using same notations

define  $p_n(f, g) = \sup \{d(f, g) : z \in K_n\}$

↓ use it

$$p(f, g) = \sum_{n=1}^{\infty} \frac{1}{2^n} \frac{p_n(f, g)}{1 + p_n(f, g)}.$$

\* converges because  $\frac{t}{1+t} < 1 \forall t > 0$  and  $\frac{1}{2^n} \xrightarrow{\text{use seqn}} 0$   
 hence, converges  
 (using 3.42, Rudin)

Lemma: Let  $(S, d)$  be a metric space, then,  $\mu(a, b) = \frac{d(a, b)}{1 + d(a, b)}$   
 is a metric on  $S$ . (i)  $X \subseteq (S, d)$   $\Leftrightarrow X \subseteq (S, \mu)$   $\text{open}$

(ii)  $\{f_n\}$  Cauchy in  $(S, d) \Leftrightarrow \{f_n\}$  Cauchy in  $(S, \mu)$

Theorem:-  $(C(U), \mu)$  is a metric space.

Lemma:- Given  $\epsilon > 0$ ,  $\exists \delta > 0$  and  $K \subseteq U \ni K \subseteq \text{compact}$   $\exists$  for  $f, g \in C(U)$   
 $\sup \{d(f, g) : z \in U\} < \delta$   
 $\Rightarrow \mu(f, g) < \epsilon$

\* Converse is also true!

Proof:- fix  $p \in \mathbb{N} \Rightarrow \sum_{n=p+1}^{\infty} \left(\frac{1}{2}\right)^n < \frac{\varepsilon}{2}$ . Let  $K = K_p$ , defined above

$$\text{Now, } \sup_K d(f, g) < \delta \Rightarrow \sum_{n=1}^p \frac{1}{2^n} \left(\frac{\delta}{\delta+1}\right) < \frac{\delta}{\delta+1}$$

hence choose  $\delta \Rightarrow \forall 0 < t < \delta, \frac{t}{t+1} < \frac{\varepsilon}{2}$

Now,

$$p(f, g) = \sum_{n=1}^p p_n + \sum_{n=p+1}^{\infty} p_n < \frac{\varepsilon}{2}$$

Theorem:- a)  $O \subseteq C(U)$  is open  $\Leftrightarrow \forall f \in O \exists \underset{\text{compact}}{K} \subseteq U, \delta > 0 \ni$

$\Rightarrow$

$$O \supset \{g : d(f, g) < \delta : z \in K\}$$

Proof:-  $O = \text{open}, f \in O \Rightarrow \exists \varepsilon > 0 \ni O \supset \{g : p(f, g) < \varepsilon\}$ . Using above lemma,  
 $\exists \delta > 0, K \subseteq U \ni \sup_K d(f, g) < \delta \Rightarrow p(f, g) < \varepsilon \Rightarrow \forall g \in O \ni \sup_K d(f, g) < \delta$

$\Leftarrow$  let  $f \in O$ , using converse of above lemma

$$\exists \varepsilon > 0 \ni p(f, g) < \varepsilon \text{ then } \sup_K d(f, g) < \delta$$
  
 $\Rightarrow \{g : p(f, g) < \varepsilon\} \subseteq O \Rightarrow O = \text{open}$

$\square O$

Lemma:-  $\{f_n\}$  in  $C(U, \mathbb{R})$  converges to  $f \Leftrightarrow \{f_n\} \xrightarrow{a.u} f$ .

Proof:-  $\Rightarrow \exists N \in \mathbb{N} \ni p(f_n, f) < \varepsilon \quad \forall n \geq N$ .

Let  $K \subseteq U, \delta > 0$  be given.

To prove:  $\sup_K d(f, f_n) < \delta \quad \forall n \geq N$

using prw. lemma,  $\exists \varepsilon > 0 \ni p(f, f_n) < \varepsilon \Rightarrow$

hence proved.

$\Leftarrow$  let  $f_n \xrightarrow{a.u} f$

$\Rightarrow \forall K \subseteq U, f_n \xrightarrow{u} f$  i.e.  $\forall z \in K, d(f_n, f) < \varepsilon \quad \forall n \geq N$

now, let  $\varepsilon > 0$ . we know  $\exists \delta > 0, K \subseteq U \ni \sup_K d(f, f_n) < \delta$

using ①,  $\exists N \geq 1 \ni \forall n \geq N, \sup_K d(f_n, f) < \delta \Rightarrow p(f, f_n) < \delta$

hence proved.

①

Theorem :-  $\tilde{F} \subseteq H(U)$ , uniformly bounded on all  $K \subseteq U$ .  
then,

- i)  $\tilde{F}$  is equicontinuous on all  $K \subseteq U$   
 $\downarrow$
- ii)  $\tilde{F}$  is compact

Montel's Theorem

(i) is by CIF.  
as follows:-

proof :- (i)

## Montel's Theorem proof (ii)

- ①  $\tilde{F} \subseteq H(U)$  such that it is uniformly bounded on each  $K \subseteq U$  compact. Then  $\tilde{F}$  is compact
- ②  $\tilde{F} \subseteq H(U)$ .  
 every sequence in  $\tilde{F}$  has a l.p in  $H(U) \Leftrightarrow \tilde{F}$  is locally bounded  
 [converse of above statement, proved in section "Compactness Criterion"]

Statement ①

proof:-  $\{f_n\}^\infty \subseteq \tilde{F}$ . To show: it has a conv. subseq.  
 that is, on some Dense subset.

Consider  $S = \{z_1, \dots\}$  a dense subset of  $U$ .  
 we show  $\exists \{f_{n_k}\}, \ni \{f_{n_k}\}^\infty$  converges pt. wise on  $S$ .

$$S = \{z_1, z_2, \dots\}$$

$f_1(z), f_2(z), \dots$ , bdd seq.  $\Rightarrow$  convergent subsequence

let it be  $\{f_{1j}(z)\}_{j=1}^\infty$  convergent on  $z_1$

Now write,  $f_{11}(z_2), f_{12}(z_2), \dots$

again bounded  $\Rightarrow \{f_{2j}(z)\}$  convergent on  $z_1, z_2$

so on. Inductively Doable.

Create a sequence,  $f_{11}(z), f_{12}(z), \dots$

Clearly, convergent  $\forall z \in S$ .

# Compactness Criterion

$\mathcal{F} \in H(U)$  is compact  $\Leftrightarrow \mathcal{F}$  is closed and uniformly bounded on each  $K \subseteq U$

proof:- Assume  $\mathcal{F}$  is compact.

Let  $K \subseteq U$ .

Consider,  $\mathcal{F} \rightarrow \mathbb{R}_{>0} : f \mapsto \|f\|_K$

$$= \left\{ \sup_{z \in K} |f(z)| \right\}$$

Note:-  $X \rightarrow$  compact Metric Space

$$C(X) \rightarrow \mathbb{R}_{>0}$$

(Fix  $g$ )  $f \mapsto \|f\|_X$  is a metric. Consider a set,  $S$  such that all  $f \in S$  be  $\exists \|f-g\|_X < \epsilon$ . Clearly on  $X$ , this set is bounded. (uniformly)

$\mathcal{F}$  being compact  $\Rightarrow \exists$  finite no. of such sets covering  $\mathcal{F}$  up, hence, uniformly bounded on  $X$ .  
Hence proved.

The converse.

$\mathcal{F} = \text{closed}$   $\mathcal{F}$  is uniformly bounded  $\Rightarrow \overline{\mathcal{F}} = \text{compact}$ . (Montel Theorem)  
hence proved.

# Remark:- 1. It doesn't work on  $C(U)$ .

2. It proves converse of Montel's Theorem.

Theorem:-

$\mathcal{F} \subseteq H(U)$  &  $z_0 \in U$ .  $\Rightarrow \exists g \in \mathcal{F} \exists \epsilon \forall f \in \mathcal{F}$

$$|g(z_0)| > |f(z_0)|$$

proof:-  $f \rightarrow \mathbb{R}_{\geq 0}$

$f \rightarrow \|f'(z_0)\|$  is continuous.

Assume  $f_n \xrightarrow{a.u} f \Rightarrow f_n'(z_0) \rightarrow f'(z_0)$

Hence, maxima exists

### Corollary (Compactness Criterion)

$U \rightarrow$  Region.  $z_0 \in U, \epsilon > 0$ . Consider  $\mathcal{F} = \{f: U \rightarrow \bar{\mathbb{D}} : f \text{ is } 1-1, \text{ holo}, |f'(z_0)| \geq \epsilon\}$

Then,  $\mathcal{F}$  is compact

proof:- Enough to show  $\mathcal{F}$  is closed,  $[ \|f\| \leq 1, \Rightarrow \text{bdd}]$

Consider,  $\{f_n\} \subseteq \mathcal{F}$

$f_n \xrightarrow{n \rightarrow \infty} f, f \in C(U)$

[because equicontinuous. Also,  $f_n' \in H(U) \Rightarrow f \in H(U)$   
family because  $U$ -bdd on each compact set]

$\Rightarrow f_n \xrightarrow{a.u} f \rightarrow |f_n'(z_0)| \rightarrow |f'(z_0)|$

as  $|f_n'(z_0)| \geq \epsilon \Rightarrow |f_n'(z_0)| \geq \epsilon$

Using previous corollaries of Hurwitz

Theorem

$\Rightarrow f \equiv \text{constant or } 1-1$

$\downarrow$

X because  $|f'(z_0)| > \epsilon$

hence  $f$  is one-one.  $\Rightarrow f \in \mathcal{F} \Rightarrow \mathcal{F}$  is closed

Hence Proved

Remember:- uniformly bdd on each  $K \subseteq U$   
 $\Rightarrow$  equicontinuity  
 $\Rightarrow$  (convergence  $\equiv$  a.u convergent)  
 $\Rightarrow$  holo  $\rightarrow f = \text{holo}$

Theorem :-  $U \subseteq C$ ,  $U \neq C \ni \forall f \in H(C) (f \neq 0 \wedge z \in U)$  has an analytic square root. Then  $\exists f \in H(U)$   $\text{fill } \xrightarrow{1-1} D$

Proof :- Let  $a \in C \setminus U$ . Consider  $z \mapsto z - a : z \in U$ .  
 $\Rightarrow \exists h \in H(U) \ni \forall z \in U, h(z) = z - a$ .

Observe,  $h$  is zero-free, mu-one.

Also, from Open Mapping Theorem,  $H(U) \stackrel{\text{open}}{\subseteq} C$ .

Define  $-h(U) = \{-h(z) : z \in U\}$  is also open as:  $\varphi(h(U)) = -h(U)$  Homeomorphism

Claim :-  $h(U) \cap (-h(U)) = \emptyset$

Proof :-

Let  $w_0 \in -h(U)$

$\Rightarrow \exists r > 0 \ni D(w_0; r) \subseteq -h(U)$

$\Rightarrow D(w_0; r) \cap h(U) = \emptyset \Rightarrow$

$\forall z \in U, |h(z) - w_0| > r$ . Consider  $\psi(z) = \frac{1}{h(z) - w_0}, z \in U$ .

Clearly,  $\psi \in H(U)$  &  $|\psi(z)| < \frac{1}{r} \quad \forall z \in U$ .

$\psi$  is 1-1.

Let,  $f_0 = r\psi$ . Hence proved.

Consider  $\tilde{F}_0 = \{f: U \xrightarrow[\text{holo}]{} D : |f'(z_0)| \geq |f'_0(z_0)|\}$   
 where  $z_0 \in U$  is fixed. Note  $f'_0(z_0) \neq 0$

Since  $\tilde{F}_0$  is compact (proved above),

$\exists g \in \tilde{F}_0 \ni \forall f \in \tilde{F}_0, |g'(z_0)| \geq |f'(z_0)|$ .

We claim,

$g(U) = D$

Assume Contrary,  $g(U) \subset D$ . Then,  $\exists \alpha \in D \setminus g(U)$ . Consider

$$\psi = \varphi_\alpha \circ g.$$

Clearly,  $\psi$  is analytic, zero-free  $\Rightarrow$  admits an analytic square root, say  $h$  i.e.  $h^2 = \varphi_\alpha \circ g$ .

Clearly,  $h$  is zero-free, one-one. Put  $b = h(z_0)$ .

Define,  $f = \varphi_b \circ h$ . Then  $f(z_0) = \varphi_b(b) = 0$

$$\begin{aligned} \text{Now, } g &= \varphi_\alpha \circ h^2 = \varphi_\alpha \circ (\varphi_b \circ f)^2 = \varphi_\alpha \circ (\varphi_b^2 \circ f) \\ &= (\varphi_\alpha \circ \varphi_b^2) \circ f \end{aligned}$$

$$\text{Hence, } |g'(z_0)| = |\varphi_\alpha \circ \varphi_b^2(0)| |f'(z_0)| - *$$

as  $\varphi_b$  is 1-1  $\Rightarrow \varphi_\alpha \circ \varphi_b^2$  is not one-one.

$$\text{Hence, } |\varphi_\alpha \circ \varphi_b^2(0)| < (1 - |\varphi_\alpha \circ \varphi_b^2(0)|^2)$$

using \*,  $|g'(z_0)| < |f'(z_0)|$ . But  $f$  should be injective and also,

$$|f'(z_0)| > |g'(z_0)| \geq |f'_0(z_0)|. \text{ This implies } f \in \mathcal{F} \Rightarrow \Leftarrow$$

### Remark

① If  $g$  is a maximizer of  $\{ |f'(z_0)| : f \in \mathcal{F} \}$  then  $g(z_0) = 0$ . Otherwise consider  $\varphi_\alpha \circ g$ ,  $\alpha = g(z_0)$ . Then,  
 $|\varphi_\alpha \circ g(z_0)| = |\varphi_\alpha(\alpha) g'(z_0)| = \frac{1}{1-|\alpha|^2} g'(z_0) > |g'(z_0)| \geq |f'(z_0)|$   
 $\Rightarrow \varphi_\alpha \circ g \in \mathcal{F} \Rightarrow \Leftarrow$

② Let  $g$  be as above. Suppose  $f: U \xrightarrow{\text{holo}} D$ ,  $f(z_0) = 0$ .  
Then  $f \circ g^{-1}: D \rightarrow D$  fixes origin. From Schwarz lemma  
 $\forall z \in D$ ,

$$|f \circ g^{-1}| \leq |z| \Rightarrow |f(w)| \leq |g(w)| \quad \forall w \in U$$

and

$$|(f \circ g^{-1})'(0)| = |f'(z_0) \cdot \frac{1}{g'(z_0)}| \leq 1 \Rightarrow |f'(z_0)| \leq |g'(z_0)|$$

Furthermore, If  $|f(w)| = |g(w)|$  for some  $w \neq z_0$ ,  
 $\Leftrightarrow f = hg$  for some  $|h|=1$ .

### Uniqueness :-

Suppose  $g_1, g_2 : U \rightarrow D$  are bijective, holomorphic.  
 $g_1(z_0) = g_2(z_0) = 0$ . Then,  $g_1 \circ g_2^{-1} \in \text{Aut}(D)$ , fixes origin.  
 hence,

$$g_1 = h g_2, \text{ for some } |h|=1$$

\* Let  $U$  be as before. Then  $\exists!$  bijective holomorphic function  $g : U \rightarrow D$  satisfying  $g(z_0) \neq 0, g'(z_0) > 0$  \*

If  $g_1 = h g_2 \ni \exists$ , then,  $g_1 = h g_2 \Rightarrow h > 0 \Rightarrow h=1$

\* We proved that,  $U \subseteq C$ , open, connected, simply connected then if every zero-free analytic function admits an analytic square root. then  $\exists f : U \xrightarrow[\text{onto}]{} D$

↓  
Goal is to reduce this square root assumption to simply connectedness only.

Theorem :- T.F.A.E,  $U \subseteq C$   
 open, connected

1.  $\forall z \in C \setminus U$  & closed path  $\gamma$  in  $U$ ,  $\text{Ind}_\gamma(z) = 0$
2.  $\forall f \in H(U)$ ,  $\int f = 0$
3.  $\forall f \in H(U)$ ,  $f$  admits a primitive
4. Every zero-free  $f \in H(U)$ , admits a analytic logarithm
5. " " " " " , " a analytic  $n^{\text{th}}$  root  
 $+ n = 1, 2, \dots$
6. " " " " " , " " " " " root for infinitely many  $n$
7. " " " " " admits an analytic square root.

8.  $U$  is conformally equivalent to  $D$  provided  $U \subset C$
9.  $U$  is homeomorphic to  $D$ . ( $C \xrightarrow{\text{homeomorphism}} D, z \mapsto \frac{z}{|z|}$ )
10. Every closed curve in  $U$  is null-homotopic.  
[path replaced by curve]
11. Every closed path in  $U$  is null-homotopic.  
i.e.  $U$  is simply connected.

1.  $\rightarrow$  9. is same.

Now, take pre-image from  $f$  of  $\gamma_s$ .

$$f \circ \sigma_0 = \gamma_0$$

$f \circ \sigma_1 = \gamma_1$ . taking appropriate composition,  
we get  $\sigma_0$  is homotopic to  $\sigma_1$ .

\* hence, homotopic is

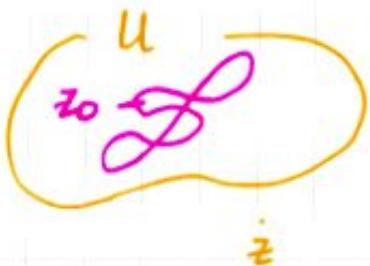

homomorphically transferable and  
it is an iff statement

to prove

9.  $\rightarrow$  10., we use and claim that every  
closed curve  
is null-homo  
topic

11.  $\rightarrow$  1.

is clear,  $\int f = \int f = 0$

$$\int f = \int_{\gamma_0} f$$

$$\text{Ind}_{\gamma_0}(z) = 0$$

\* in these statements, diffeomorphism is a specificity !!!

## More on CONFORMAL MAPS+

$U \subseteq \mathbb{C}$ ,  $f: U \xrightarrow{\text{holo}} \mathbb{C}$ ,  $f'(z) \neq 0$ ,  $\forall z \in U$

Recall:-  $V = \mathbb{R}^n$ ,  $v, w \in V, \neq 0$ .

$$-1 \leq \frac{\langle v, w \rangle}{\|v\| \|w\|} \leq 1 \quad \theta = \cos^{-1}\left(\frac{\langle v, w \rangle}{\|v\| \|w\|}\right).$$

preservation of angles

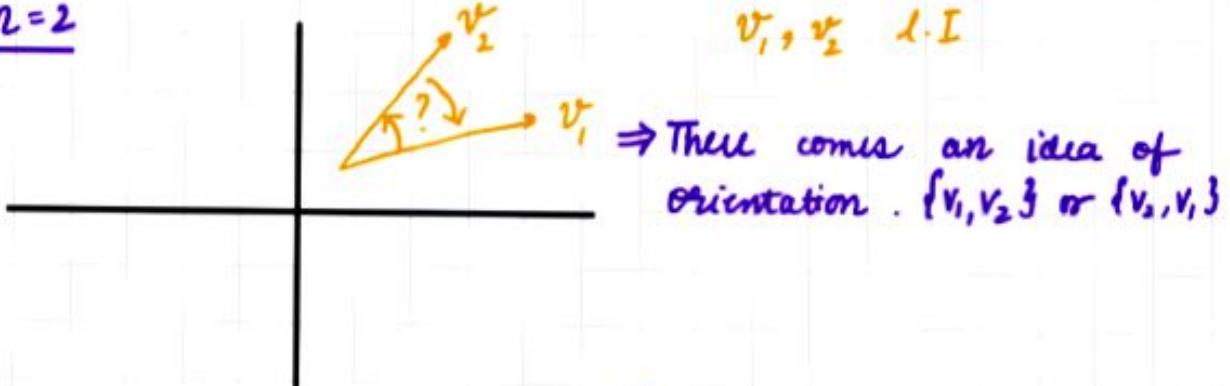

Def<sup>n</sup>:-  $T: \mathbb{R}^n \xrightarrow{\text{linear}} \mathbb{R}^n$  preserves angle if  $\frac{\langle v, w \rangle}{\|v\| \|w\|} = \frac{\langle T(v), T(w) \rangle}{\|T(v)\| \|T(w)\|}$

\* Observe that,  $\forall v \neq 0, Tv \neq 0$   $\forall v, w \neq 0$   
 $\Rightarrow \text{Ker}(T) = \text{trivial} \Rightarrow \text{Invertible}$

Theorem:-  $T: \mathbb{R}^n \rightarrow \mathbb{R}^n$  preserves angle iff  $\exists \lambda > 0 \ni \lambda T$  is orthogonal.

Now,

$n=2$

Def<sup>n</sup>:- Given 2 ordered basis of  $\mathbb{R}^n$ ,  $\{v_1, \dots, v_n\}, \{w_1, \dots, w_n\}$  all of same orientation if the linear map  $T$  that sends  $v_i$  to  $w_i$  has positive determinant.

Def<sup>n</sup>:-  $\{v_1, \dots, v_n\}$  is positively oriented if  $\det(v_1, v_2, \dots, v_n) > 0$

In  $n=2$ , when we say angle preserving, we will imply that it is oriented angles preserving linear maps i.e

$T$  preserves angles + orientation of angle formed by  $v_1, v_2$ .

In  $\mathbb{R}^2$ , combining with Theorem, we get.

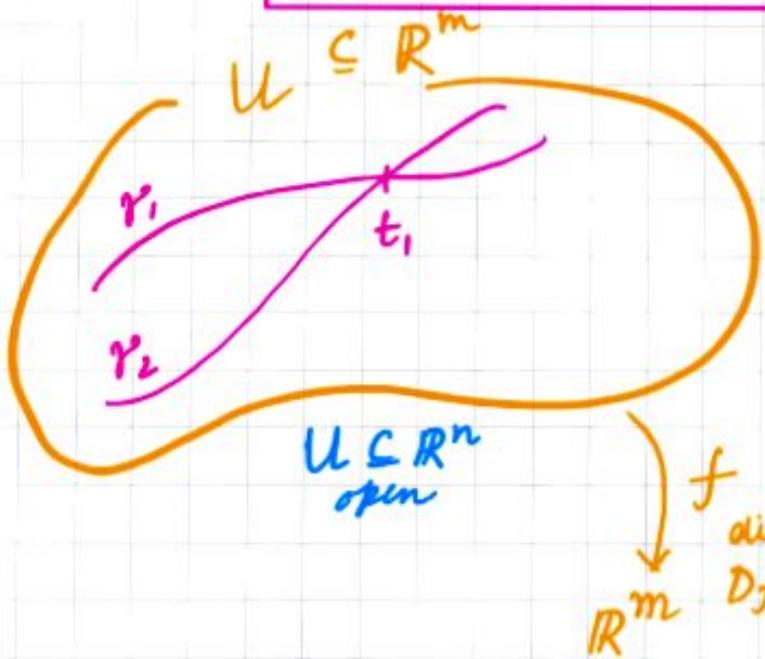

Any linear map preserving angles with orientation must have determinant +ve and  $\exists \lambda > 0 \Rightarrow \lambda T$  is orthogonal

Thus the matrix of  $\lambda T$  w.r.t standard basis,

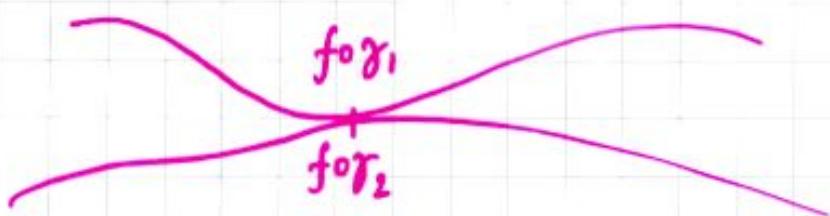

$$= \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}$$

[because  
 $\det > 0$ ,  
reflection  $\det = -1$ ]

$$\Rightarrow T = \lambda^{-1} \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}$$

Consider 2 diff curves  $\gamma_1, \gamma_2$   
 $\gamma_1: [a_1, b_1] \xrightarrow{\text{diff}} U$ ,  
 $\gamma_2: [a_2, b_2] \xrightarrow{\text{diff}} U \ni \exists t_1, t_2 \in (a_1, b_1),$   
 $\gamma_1(t_1) = \gamma_2(t_2) = z_0 \in \mathbb{C}_{a_1, b_1},$   
and  $\gamma'_1(t_1) \neq 0, \gamma'_2(t_2) \neq 0$

Theorem:-  $f$  preserves angle b/w curves iff  $Df(z_0): \mathbb{R}^n \rightarrow \mathbb{R}^n$  is angle preserving

Observe for  $n=2$ , orientation is also preserved

Analysis

$$\text{Theorem} \Rightarrow Df(z_0) = \lambda^{-1} \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}$$

i.e. It satisfies Cauchy-Riemann eq's  $\Rightarrow$  f is holomorphic at  $z_0$

also,  $f'(z_0) \neq 0$ ,  $|f'(z_0)|^2 = \det(Df(z_0, y_0))$

\* Holomorphic maps with non-zero derivatives are characterized by angle preserving maps. \*

Remember Möbius Transformation

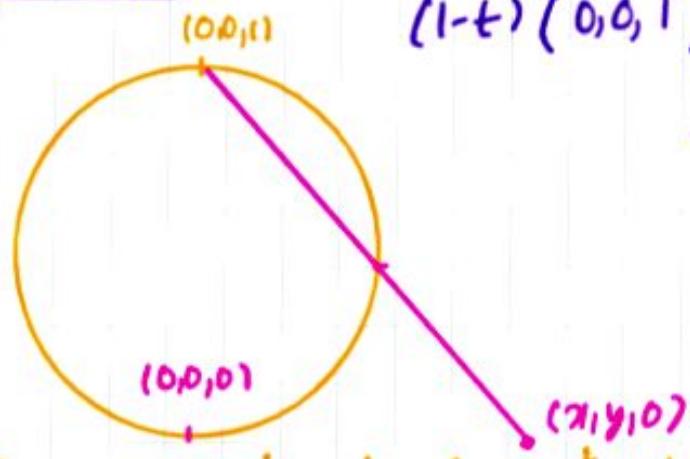

$$f_H : \mathbb{H} \rightarrow \mathbb{H}$$

$$M = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \quad f_H(z) = \frac{az+b}{cz+d} \in SL_2(\mathbb{R})$$

### Stereographic Maps

Consider a surface  $(x, y) \longleftrightarrow (x, y, 0)$

$$(1-t)(0, 0, 1) + t(x, y, 0) = (tx, ty, 1-t) \in \text{surface}$$
$$\Rightarrow t = \frac{1}{1+x^2+y^2}$$

$$\{(x_1, x_2, x_3) : x_1^2 + x_2^2 + (x_3 - \frac{1}{2})^2 = \frac{1}{4}\}$$

### Stereographic Projection

$$\phi: (x, y) \longmapsto \left( \frac{x}{1+x^2+y^2}, \frac{y}{1+x^2+y^2}, \frac{x^2+y^2}{1+x^2+y^2} \right)$$

\* Every point on plane has 1 point on sphere when joined with North Pole

Because

$$\psi: (x_1, x_2, x_3) \longmapsto \left( \frac{x_1}{1-x_3}, \frac{x_2}{1-x_3} \right), \psi: S/\{0, 0, 1\} \xrightarrow{\text{onto}} \mathbb{R}^2$$

$\phi + \psi$  are inverse to each other

$\mathbb{R}^2$  is homeomorphic to  $S^1$  (one point of  $y$ )

Define  $\hat{\mathbb{C}} = \mathbb{C} \cup \{\infty\}$

$\Phi : \mathbb{C} \cup \{\infty\} \longrightarrow S \subseteq \mathbb{R}^3$  [extend  $\varphi$  for whole  $S$ ]

$$\underline{\Phi}(x+iy) = \begin{cases} \underline{\Phi}(x,y) & : (x,y) \in \mathbb{R}^2 \\ (0,0,1) & : (x,y) = \infty \end{cases}$$

By Construction, it is Bijective

### Geometric

Consider

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ \uparrow & & \uparrow \\ \text{set} & & (Y, d) = \text{metric space} \end{array}$$

Let  $x_1, x_2 \in X$ . Consider  $d(f(x_1), f(x_2))$

$$x_1, x_2 \xrightarrow{df} d(f(x_1), f(x_2))$$

$\downarrow$  helps in  
defining a  
metric on  
 $X$ !

Thus  $f : (X, d_f) \longrightarrow (Y, d)$   
preserves distance  $\Rightarrow$  Geometric

Assume  $f$  is onto as well!

$f$  is one-one

$$f^{-1}(Y, d) \longrightarrow (X, d_f)$$

Since  $f$  is isometry, so is  $f^{-1} \Rightarrow$  continuous  
Then  $X, Y$  are homeomorphic

We use this Theory to metrize  $\hat{\mathbb{C}}$  using  $\Phi$   
 $\mathbb{C} \subseteq \hat{\mathbb{C}}$ .

### Observations.

1.  $\hat{\mathbb{C}}$  is homeomorphic to  $S \Rightarrow \hat{\mathbb{C}}$  is compact + connected
2.  $\hat{\mathbb{C}}$  is isometric to  $S \Rightarrow$  complete metric space  
ie every Cauchy  $\Rightarrow$  convergent
3.  $\mathbb{C}$  has 2 metrics,

(i) one is original,

$$(ii) \quad \hat{d}(z, w) = \begin{cases} \frac{|z-w|}{\sqrt{1+|z|^2}\sqrt{1+|w|^2}} & : (z, w) \in \mathbb{C}^2 \\ \frac{1}{\sqrt{1+|z|^2}} & : z \in \mathbb{C}, w = \infty \end{cases}$$

\* \* 4. Let  $\{z_n\}_{n=1}^{\infty}$  be a seq<sup>n</sup> in  $\hat{\mathbb{C}}$ . Then  $\{z_n\}$  converges to  $\infty$   
iff  $\{|z_n|\}_{n=1}^{\infty}$  diverges to  $\infty$ .

### General Möbius Transformation

$$g = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in GL_2(\mathbb{C}) \quad , \quad ab - cd \neq 0 \\ a, b, c, d \in \mathbb{C}$$

$$f_g(z) = \begin{cases} \frac{az+b}{cz+d} & : z \neq -\frac{d}{c} \\ \infty & : z = -\frac{d}{c} \\ \frac{a}{c} & : z = \infty \end{cases}$$

Clearly,

$$\phi = f_g : \hat{\mathbb{C}} \rightarrow \hat{\mathbb{C}}$$

$$\text{if } c=0 \text{, then } f_g(z) = \begin{cases} \frac{az+b}{d} & : z \in \mathbb{C} \\ \infty & : z = \infty \end{cases}$$

Observe :-

i)  $\phi : \mathbb{C} \setminus \{-\frac{d}{c}\} \rightarrow \mathbb{C}$  is holomorphic

ii)  $z \neq -\frac{d}{c} \Rightarrow$  derivative at  $z$  is  $\frac{ad-bc}{(cz+d)^2} \neq 0$

\* Hence,  $\phi : \mathbb{C} \setminus \{-\frac{d}{c}\} \rightarrow \mathbb{C}$  is Conformal map!

iii)  $\mathbb{C} \xrightarrow{\text{this map}} \mathbb{C}$  is the [ extend using limit + pwr. Theorem ]

iv)  $\forall g_1, g_2 \in GL_2(\mathbb{C})$

$$f_{g_1 g_2} = f_{g_1} \circ f_{g_2} \quad \& \quad f_{I_2} = \text{Id map}$$

Thus  $GL_2(\mathbb{R})$  acts on  $\hat{\mathbb{C}}$

### Example

1) Translations

$$z \rightarrow z + b$$

$$\begin{pmatrix} 1 & b \\ 0 & 1 \end{pmatrix}$$

2) Rotation

$$z \rightarrow e^{i\theta} z$$

$$\begin{pmatrix} e^{i\theta} & 0 \\ 0 & \bar{e}^{i\theta} \end{pmatrix}$$

3) Dilation

$$z \rightarrow az$$

$$\begin{pmatrix} r & 0 \\ 0 & \frac{1}{r} \end{pmatrix}$$

4) Inversion

$$z \rightarrow \frac{1}{z}$$

$$\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$$

→ All Möbius Transformations can be built from these 4

Observe:-  $c \neq 0$ ,

$$\frac{az+b}{d} = \underbrace{|a|}_{\text{Dilation}} \cdot \underbrace{\frac{az}{|a|}}_{\text{Rotation}} + \underbrace{b/d}_{\text{Translation}}$$

### Analysis

$f_M(z) = z$  has i) 2 solutions if  $M \neq I_2$   
 ii) 3 " if  $M = I_2$

Lemma :- Given  $z_1, z_2, z_3 \in \mathbb{C}$ , all distinct,  $\exists! M \in GL_2(\mathbb{C}) \ni$   
 $f_M(z_1) = \infty, f_M(z_2) = 1, f_M(z_3) = 0$

Proof:- existence

Consider  $f_M(z) = \frac{(z-z_3)(z_1-z)}{(z-z_1)(z_2-z)}$ . Clearly all properties satisfied.

### Uniqueness

Suppose 2 such Transf.

$f_{M_1} f_{M_2^{-1}}$  fixes 3 pts  $\Rightarrow M_1 M_2^{-1} = I_2 \Rightarrow M_1 = M_2$

Theorem:-  $\exists! M \in GL_2(\mathbb{C}) \ni f_M(z_i) = w_i, i=1,2,3 \ni z_i \neq z_j \forall i \neq j$   
proof:- Consider

$$\begin{array}{ccc} M_1 & \xrightarrow{\quad} & M_2 \\ z_i \downarrow & w_i \downarrow & \\ 0,1,\infty & 0,1,\infty & \end{array}$$

Clearly  $f_{M_1 M_2^{-1}}$  is the required map.

\* This sends lines + circles to lines + circles  
 $\downarrow$

To get image of a map. Knowledge of how it acts on boundary is enough

proof:-  $S$  be a circle in  $\mathbb{C} \Rightarrow S$  is invariant to dilations, translations, rotations.

Check for invariance.  $|z - z_0| = r$ , let  $w = \frac{1}{z}$ .  
 then,

$$|z|^2 - 2\operatorname{Re}(z z_0) - r^2 = 0 \Rightarrow \frac{1}{|w|^2} - 2 \frac{\operatorname{Re}(w z_0)}{|w|^2} + |z_0|^2 - r^2 = 0$$

If  $|z_0| \neq r$  then,  $|w|^2 - \frac{2\operatorname{Re}(w z_0)}{|z_0|^2 - r^2} + \frac{1}{|z_0|^2 - r^2} = 0$

i.e.  $|w|^2 - 2\operatorname{Re}(w \bar{z}_0) + c = 0$   
 $= \underline{\text{circle}}$ .

If  $|z_0| = r$ , then,  $2\operatorname{Re}(w z_0) = 1 \quad w = u + iv$

i.e.  $(ux_0 - vy_0) = \frac{1}{2} = \text{line in } \mathbb{C} \text{ and } \infty$

hence a circle as (line  $\cup \{\infty\}$ )

as  $w = \frac{1}{z}$   
 $+z=0 \text{ at origin}$

Let  $S = \text{line}, 2\operatorname{Re}(z \bar{z}_0) = a, a \in \mathbb{R}$

$\Rightarrow w = \frac{1}{z} \Rightarrow 2\operatorname{Re}(w \bar{z}_0) = a|w|^2$ . If  $a=0$ , line through origin

else,  $w z_0 + \bar{w} \bar{z}_0 - a w \bar{w} = 0$

$$\Rightarrow w \bar{w} - \frac{w z_0}{a} - \frac{\bar{w} \bar{z}_0}{a} + \frac{|z_0|^2}{a^2} - \frac{|w|^2}{a^2} = 0$$

= circle in  $\mathbb{C}$

## Isolated Singularities SINGULARITIES

Defn:-  $U \subseteq \mathbb{C}$  open,  $z_0 \in U$ ,  $f: U \setminus \{z_0\} \rightarrow \mathbb{C}$

Then we say  $z_0$  is an isolated singularity at  $z_0$ .

↓  
Removable Singularity

If  $f$  can be re-defined at  $z_0 \ni$  extension is holo at  $z_0$ .

Lemma:-  $f$  has removable singularity at  $z_0$  iff  $\exists r > 0$   
 $\Rightarrow D(z_0, r) \setminus \{z_0\} \subseteq U$  and  $f$  is bounded on  
 $D(z_0, r) \setminus \{z_0\}$

### Types of Singularity

$U \subseteq \mathbb{C}$  open,  $z_0 \in U$ ,  $f: U \setminus \{z_0\} \rightarrow \mathbb{C}$ . Then one of  
following must be true,

i)  $\exists r > 0 \ni f(D(z_0, r) \setminus \{z_0\})$  is dense in  $\mathbb{C}$

If not then?

$\forall r > 0 \exists w \in \mathbb{C}, \delta > 0 \ni |f(z) - w| \geq \delta \quad \forall z \in D(z_0, r) \setminus \{z_0\}$

Consider,  $g(z) = \frac{1}{f(z) - w}, z \in D(z_0, r) \setminus \{z_0\}$

$$|g(z)| \leq \frac{1}{\delta}$$

$\Rightarrow g$  has a removable singularity at  $z = z_0$ .

Extend  $g$ , call it  $g$  as well!

Case I :-  $g(z_0) \neq 0 \Rightarrow \lim_{z \rightarrow z_0} g(z)$  exists  $\Rightarrow$

$\lim_{z \rightarrow z_0} \frac{1}{f(z)-w}$  exists and not  $\infty$

Hence,  $f(z)$  is bounded  $\Rightarrow$  removable singularity

Case II :-  $g(z_0) = 0$

Let  $m > 0$  be the order of the zero  $z_0$ .

$$\Rightarrow g(z) = (z - z_0)^m g_1(z), \quad g_1 \in H(D(z_0, R)) \text{ &} \\ g_1 \text{ is zero-free in neighbourhood of } z_0,$$

hence,

$$f(z) = w + \frac{1}{(z - z_0)^m} \times \underbrace{\frac{1}{g_1(z)}}_{\text{analytic because non-zero in } D(z_0, R)}$$

hence,

$$f(z) = w + \frac{a_0}{(z - z_0)^m} + \dots + a_m$$

$$+ (a_{m+1}(z - z_0) + a_{m+2}(z - z_0)^2 + \dots)$$

i.e

$$f(z) - \sum_{k=0}^m \frac{a_k}{(z - z_0)^{m-k}} = w + \underbrace{\phi(z)}_{\forall z \in D(z_0, R) \setminus \{z_0\}}$$

defined  $\forall z \in D(z_0, R)$

hence, Removable singularity for both sides

$\Rightarrow f(z) - \underbrace{\sum_{k=0}^m \frac{a_k}{(z - z_0)^{m-k}}}_{\text{has removable singularity at } z_0.}$

This  $z_0$  is called a "pole"

Principal part of  $f$  at  $z_0$ .

\* 3 possible scenarios of isolated singularity at  $z_0$  \*

- ① Removable :-  $\lim_{z \rightarrow z_0} f(z)$  exists and is finite
- ② Pole :-  $\lim_{z \rightarrow z_0} f(z) = \infty$  or  $\lim_{z \rightarrow z_0} \frac{1}{f(z)} = 0$
- ③ Essential :- If  $\lim_{z \rightarrow z_0} f(z)$  D.N.E., or  $f(z)$  dense in  $\mathbb{C}$  Range.

### Analysis of Poles

#### uniqueness

$$\exists r > 0 \ni f(z) = \sum \frac{a_k}{(z - z_0)^{m-k}} + h(z) \quad \text{where } h(z) \in H(D(z_0, r)) \setminus \{z_0\}$$

Thus, This expansion is unique

Proof :- Suppose not,  $f(z) = \sum_{k=1}^m \frac{b_k}{(z - z_0)^{m-k}} + h_2(z)$  for some  $h_2(z) \in H(D(z_0, r))$

$$\underbrace{\sum \frac{b_k - c_k}{(z - z_0)^{m-k}}}_{\text{non-removable}} = h(z) - h_2(z) \in H(D(z_0, r))$$

non-removable

singularity at  $z_0$  if  $\exists k \ni c_k \neq b_k$ ,  $\Rightarrow$ .

Observe,  $m$  is unique because  $h(z)$  is defined at  $z_0$ .  
If we change  $m$ ,  $h(z)$  won't be holomorphic anymore.

## MEROMORPHISM

$U \subseteq \mathbb{C}$ ,  $A \subseteq U$ .  
open

$f$  is said to be Meromorphic if

1.  $f: U \setminus A \xrightarrow{\text{holo}} \mathbb{C}$
2.  $\forall z \in A$ ,  $z$  is a pole of  $f$
3.  $A$  has no limit point in  $U$ .

Remark: \*  $\forall k \in U$ ,  $k \cap A$  is finite

\*  $A$  is countable

\*  $f \in H(U) \Rightarrow f$  is meromorphic

### Residues

$U \subseteq \mathbb{C}$ ,  $f \in H(U)$ , assume  $f \neq 0$   $\forall z \in U \Rightarrow z(f)$  has no l.pt in  $U$ .

Then,  $\exists m \in \mathbb{N} + g_i \in H(D(z_0, r))$  Consider  $\frac{g}{f} = \frac{f'}{f}$ . Let  $z_0 \in z(f)$ .

$$\Rightarrow f(z) = (z - z_0)^m g_i(z) + g_i(z) \neq 0$$

$$\Rightarrow \frac{f'}{f} = \frac{m}{z - z_0} + \underbrace{\frac{g_i'(z)}{g_i(z)}}_{\in H(D(z_0, r))}$$

\* By uniqueness,  $\frac{f'}{f}$  has a pole at  $z_0$  of order 1

Let  $f$  be meromorphic,  $A$  be set of poles of  $f$ .

$$\text{Define, } z_0 \in A, Q(z) = \sum_{k=1}^m \frac{c_k}{(z - z_0)^k}$$

Then,  $c_k$  is called Residue of  $f$  at  $z_0$  denoted by  $\text{Res}(f, z_0)$

## Observations :-

$$\frac{1}{2\pi i} \int_{\gamma} Q = \frac{c_1}{2\pi i} \int_{\gamma} \frac{dz}{z - z_0} + \sum_{k=2}^{\infty} \frac{1}{2\pi i} \int_{\gamma} \frac{dz}{(z - z_0)^k}$$

have primitive  $\Rightarrow \int_{\gamma} = 0$

$$\text{Hence, } \frac{1}{2\pi i} \int_{\gamma} Q(z) = \frac{1}{2\pi i} \int_{\gamma} f(z) = \text{Res}(f, z_0) \text{Ind}_{\gamma}(z_0)$$

where  $\gamma \in D(z_0, r)$ ,  $z_0 \notin \gamma^*$

## Residue Theorem

Let  $f$  be as before, suppose that  $\gamma$  is a cycle  
 $\Rightarrow \gamma^* \subseteq U \setminus A$  & assume  $\gamma \neq 0$

$$\text{Then, } \frac{1}{2\pi i} \int_{\gamma} f = \sum_{a \in A} \text{Res}(f, a) \text{Ind}_{\gamma}(a)$$

Observe:-  $\sum_{a \in A} \text{Res}(a, f) \text{Ind}_{\gamma}(a)$  is a finite sum!

Let  $B = \{a \in A : \text{Ind}_{\gamma}(a) \neq 0\}$

i)  $B$  is bounded : because,  $C \setminus \gamma^*$  has only one unbounded component and  $\forall z$  in it  $\text{Ind}_{\gamma}(z) = 0$

ii)  $B$  has no limit points : If it does, say  $z_0$ , then  $z_0 \notin U$   
because  $B \subseteq A$  &  $A$  has no l.p. in  $U$

Observe  $\gamma^* \subseteq U \Rightarrow \text{Ind}_{\gamma^*}(z_0) = 0$ . and because its a l.p.  
 $\exists (z_n) \subseteq B \ni z_n \rightarrow z_0$ .  $\Rightarrow \text{Ind}_{\gamma^*}(z_n) \rightarrow \text{Ind}_{\gamma^*}(z_0)$   
 $\neq 0, \epsilon \mathbb{Z}^+ = 0$   
since, no limit point

Using Bolzano-Weierstrass Theorem,  $B = \text{finite}$

### Analysis of $B + f$

Let  $B = \{z_1, \dots, z_n\}$ . Let  $Q_1, \dots, Q_n$  be the resp. principal parts.

$$= \underbrace{(f - Q_1)}_{\substack{\text{Removable} \\ \text{sing at } z_1}} - \underbrace{(Q_2 + \dots + Q_n)}_{\substack{\text{holo at } z_1 \\ \text{removable sing at } z_1}}$$

Consider  $f - Q_1 - Q_2 - \dots - Q_n$ ,  $U \setminus \{z_1, \dots, z_n\}$

$\Rightarrow f - \sum_i^n Q_i$  is extendable to a holomorphic function for  $U \setminus (A \setminus B) = U$ ,

\* as we picked only those poles with finite index

Proposition :-  $\frac{1}{2\pi i} \int_{\gamma} f - \sum Q_i = 0$

i.e.  $\frac{1}{2\pi i} \int_{\gamma} f = \sum_1^n \text{Res}(f, z_i) \text{Ind}_{\gamma}(z_i)$

because  $\int_{\gamma} f \approx 0$  ] ??? NO!

## Zeros & Multiplicity

Proposition :- Let  $U \subseteq \mathbb{C}$ ,  $f \in H(U)$  not identically zero.  
 region. Let  $\gamma$  be a cycle in  $U \ni \gamma \tilde{=} 0$ .  
 Define  $U_1 = \{z \in U : \text{Ind}_\gamma(z) = 1\} \subseteq U$  [let no zero in  $\gamma^*$  + open [  $\text{Ind}_\gamma(z) = 0 \text{ or } 1 \forall z \in \gamma(f)$  ].  
 Let  $N_f = \text{no. of zeros in } U_1$  counted acc. to multiplicity. Then,

$$N_f = \frac{1}{2\pi i} \int_{\gamma} \frac{f'}{f}$$

Proof :- Apply Residue Theorem to

$$\frac{f'}{f} \Rightarrow \frac{1}{2\pi i} \int_{\gamma} \frac{f'}{f} = \sum_{a \in Z(f)} \text{Res}\left(\frac{f'}{f}, a\right) \text{Ind}_\gamma(a)$$

$$= \sum_{a \in Z(f) \cap U_1} \text{Res}\left(\frac{f'}{f}, a\right) \times 1. \text{ Also } \frac{f'}{f} = \frac{m}{z-a} + \text{holo} \Rightarrow \text{Res}\left(\frac{f'}{f}, a\right) = m$$

hence,  $\frac{1}{2\pi i} \int_{\gamma} \frac{f'}{f} = \sum_{a \in Z(f)} \text{order}(f, a)$

Hence proved.

Recall :-

- 1)  $U \subseteq \mathbb{C}$
- 2)  $\gamma := \text{closed path in } U$
- 3)  $\gamma \tilde{=} 0 \Leftrightarrow \forall z \in U \setminus \gamma^*, \text{Ind}_\gamma(z) \in \{0\}$

Then,  $\text{Ind}_{f \circ \gamma}(0) = \frac{1}{2\pi i} \int_{\gamma} \frac{f'}{f} = \text{Zeros of } f \text{ in } U$

## Rouché Theorem

Let assumptions be as before,  $f, g \in H(U) \ni |f(w) - g(w)| < |f(w)| \forall w \in \gamma^*$   
 Then, no. of zeros in  $f, g$  are same in  $U$ ,  $\{U = \text{Region}\}$

i.e.  $\text{Ind}_{f \circ \gamma}(0) = \text{Ind}_{g \circ \gamma}(0)$

Proof :- Assumptions  $\Rightarrow \forall t \in [a, b]$

$$|f(\gamma(t)) - g(\gamma(t))| < |f(\gamma(t))| \\ \Rightarrow 0 \notin \gamma^*. \text{ Using Ex. sheet 3}$$

Hence proved.

[Also, they have same no. of zeros.]

## Applications

1)  $\int_{\gamma} \frac{f(z)}{z-a} dz$  by using an easy f'n g.

Define:-  $\gamma$  be a closed path in  $\mathbb{C}$ . We say  $\gamma$  has an interior if the image of

$$\text{Ind}_{\gamma}: \mathbb{C} \setminus \gamma^* \rightarrow \mathbb{Z} \text{ is precisely } \{0, 1\}.$$

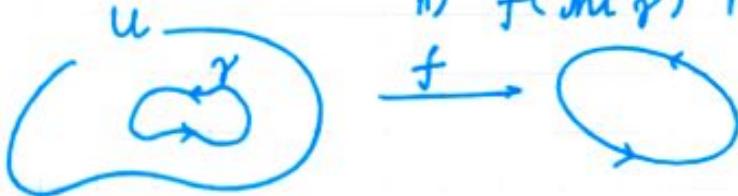

And  $\text{Int}(\gamma) = \bigcup_{n=1}^{\infty} \{z \in \mathbb{C} \setminus \gamma^* : \text{Ind}_{\gamma}(z) = n\}$

Q :- If  $\gamma$  has an interior then,  $\text{Int}(\gamma) \cup \gamma^*$  is compact

proof:-

Theorem :- Let  $U \subset \mathbb{C}$  and  $\gamma$  is a closed path in  $U$ , with  $\gamma \neq 0$ .  $f \in H(U)$  non constant. Suppose

- i)  $\gamma$  and  $f\gamma$  both have interiors
- ii)  $f(\text{Int } \gamma) \cap (f\gamma)^* = \emptyset$

Then  $f: \text{Int } \gamma \longrightarrow \text{Int}(f\gamma)$   
\*  $f$  is one-one

Also, if  $\text{Int}(f\gamma)$  is connected then  $f$  is a conformal b/w interiors.

Proof :-  $z \in \text{Int } \gamma$ .  $\text{Ind}_{f\gamma}(f(z)) = \frac{1}{2\pi i} \int_{f\gamma} \frac{d\zeta}{\zeta - f(z)}$

Claim :-  $\text{Ind}_{f\gamma}(f(z)) \geq 1$

Now, Consider  $g = f - f(z)$   
 $\text{Ind} = 0$  or  $1$  but

$g$  has a zero  $\Rightarrow \text{Ind}_{g\gamma}(0) \geq 1$   
||

hence,  $f(z) \in \text{Int}(f\gamma)$

$\text{Ind}_{f\gamma}(f(z)) \geq 1 \Rightarrow \boxed{= 1}$

$\therefore g$  has only 1 zero,  $z$  in the interior ( $\text{Ind} = 1$ )

$\Downarrow$   
 $\forall z, w \in \text{Int } \gamma, f(z) \neq f(w)$  if  $z \neq w$ .

■

Now, if  $f(\text{Int } \gamma)$  is connected.

Let  $\{w_n\}_{n=1}^{\infty}$  be conn. in  $f(\text{Int } \gamma)$

$\boxed{\begin{array}{l} \text{If } w_n \xrightarrow{n \rightarrow \infty} w \\ \text{As } \text{Int } \gamma \cup \gamma^* \text{ is compact, } \exists \text{ conn. subseq. } \{z_{n_k}\}_{k=1}^{\infty} \\ \in \text{Int } \gamma \cup \gamma^* \end{array}}$

If we show  $f(\text{Int } \gamma)$  is closed in  $\text{Int}(f\gamma)$  then done because it is open & connected  $\Rightarrow$  onto "new".

To prove  $w \in f(\text{Int } \gamma)$  :- else,  $f(z_0) \in (f\gamma)^*$  but  $z_0 \in \text{Int } \gamma$

Since,  $f(\text{Int } \gamma) \cap (f\gamma)^* = \emptyset$   
\*\*\*

Some Analysis :-  $U \subseteq \mathbb{C}$ ,  $f$  is meromorphic. Let  $P(f) = \text{set of all poles}$

[Recall:-  $P(f)$  has no limit point in  $U$ ]

If  $z_0 \in P(f)$  then  $f(z) - \sum_{k=1}^m \frac{a_k}{(z-z_0)^k}$  has a removable sing at  $z_0$ .

$$f(z) = \left( \frac{a_1}{(z-z_0)} + \dots \right) Q(z) : Q(z) \in H(U)$$

$$= \left( \frac{1}{z-z_0} \right)^m (c_m + \dots) Q(z)$$

$$= (z-z_0)^{-m} g(z), g \in H(U)$$

$$\Rightarrow \frac{f'}{f} = \frac{m}{z-z_0} + \frac{g'(z_0)}{g(z_0)} \in H$$

$$\Rightarrow \operatorname{Res}\left(\frac{f'}{f}, z_0\right) = -m$$

### Argument Principle

Let  $f$  be meromorphic, let  $\gamma^*$  be closed path in  $U$ .  
 $\exists \gamma^* \subseteq U \setminus P(f)$  and  $\gamma^* \tilde{=} 0$ . or cycle

If  $\forall w \in \gamma^*$ ,  $f(w) \neq 0$ , then

$$-\frac{1}{2\pi i} \int_{\gamma^*} \frac{f'}{f} = \sum_{z \in P(f) \cup Z(f)} \operatorname{order}_z(f) \cdot \operatorname{Ind}_{\gamma^*}(z)$$

Proof:- Obs if  $U \subseteq \mathbb{C}$ ,  $A \subseteq U$  doesn't have l-pt  $\Rightarrow U \setminus A$  = connected

$\Rightarrow U \setminus P(f)$  is a region. As  $f$  vanishes nowhere on  $\gamma^* \Rightarrow Z(f)$  has no lpt in  $U \Rightarrow U \setminus (P(f) \cup Z(f))$  is a region

$$\Rightarrow \frac{f'}{f} \in H(U \setminus P(f) \cup Z(f))$$

$$\sum_{z_0 \in Z(f)} \operatorname{Res}\left(\frac{f'}{f}, z_0\right) \operatorname{Ind}_{\gamma^*}(z_0) = \sum_{z_0 \in Z(f)} \operatorname{order}_{z_0}(f) \operatorname{Ind}_{\gamma^*}(z_0)$$

$$\text{also, } \sum_{z_0 \in P(f)} " = - \sum_{z_0 \in P(f)} \operatorname{order}_{z_0}(f) \operatorname{Ind}_{\gamma^*}(z_0)$$

Hence proved

Recall:-

Let  $R > 0$  be radius of conv. of  $f(z) = \sum_{n=0}^{\infty} c_n z^n$  then  
 $\sum c_n (z-a)^n$  is convergent for  $|z-a| > \frac{1}{R}$ .

### Cauchy Integral formula for an annulus

Let  $f \in H(D(z_0; R))$ , choose  $r_1, r_2 \ni 0 < r_1 < r_2 < R$ .  
 $\nwarrow$  punctured disk

Let  $\gamma_j(t) = z_0 + r_j e^{it} : 0 \leq t \leq 2\pi$ . Then  $\forall z \ni r_1 < |z-z_0| < r_2$ , we have,

$$f(z) = \frac{1}{2\pi i} \int_{\gamma_2} \frac{f(w)}{w-z} dw - \frac{1}{2\pi i} \int_{\gamma_1} \frac{f(w)}{w-z} dw$$

proof:-  $f(w) = \begin{cases} \frac{f(w)-f(z)}{w-z} & : w \in D(z_0; R), w \neq z \\ f'(z) & : w = z \end{cases}$

Then  $f(w) \in H(D(z_0, r))$ .

Now since  $\gamma_1 + \gamma_2$  are homotopic in the annulus.

$$\int_{\gamma_1} f = \int_{\gamma_2} f, \text{ hence,}$$

$$\int_{\gamma_2} \frac{f(w)-f(z)}{w-z} dw - \underbrace{\int_{\gamma_1} \frac{f(w)-f(z)}{w-z} dw}_{=0} = 0$$

hence proved.

## Laurent Expansion

Let  $f \in H(A(a; r, R))$  then  $f(z) = \sum_{n=-\infty}^{\infty} a_n (z-a)^n$ ,  $z \in A$

where,  $a_n = \frac{1}{2\pi i} \int_{\gamma} \frac{f(w)}{(w-a)^{n+1}} dw$  and  $\gamma = a + pe^{it}$  for some  $r < p < R$ ,  $0 \leq t < 2\pi$

Also, the series converges absolutely & uniformly on  $K \subseteq A$

Proof :-  $r < r_1 < |z-a| < r_2 < R$ . (choose  $r_1, r_2$ )

Then,

$$2\pi i f(z) = \int_{\gamma_2} \frac{f(w) dw}{w-z} - \int_{\gamma_1} \frac{f(w) dw}{w-z} = f_z + f_i \quad (\text{say})$$

$$\frac{1}{w-z} = \frac{1}{w-a+a-z} = \begin{cases} \frac{-1}{(z-a)\left(1-\frac{w-a}{z-a}\right)} & : w \in \gamma_1^+ \\ \frac{1}{(w-a)\left(1-\frac{z-a}{w-a}\right)} & : w \in \gamma_2^+ \end{cases} \quad \begin{cases} = \text{geometric} \\ \text{series} = \text{unit} \\ \Rightarrow \text{swap} \\ \int + \sum \end{cases}$$

$$\text{Therefore } f(z) = \sum_{n=0}^{\infty} \left( \frac{1}{2\pi i} \int_{\gamma_2} \frac{f(w) dw}{(w-a)^{n+1}} \right) (z-a)^n + \sum_{n=-\infty}^{-1} \left( \frac{1}{2\pi i} \int_{\gamma_1} \frac{f(w) dw}{(w-a)^{n+1}} \right) (z-a)^n$$

Now, since  $\frac{f(w)}{(w-a)^{n+1}} \in H(A)$  and  $\gamma_1 \not\supseteq \gamma_2$   
we are done.

Hence proved.

Remark:-  $a_{-1} = \operatorname{Res}(f; a)$

# Uniqueness

## Classifying singularities with Laurent Series

Case I removable sing at  $z_0$ .

$\Rightarrow \forall n < 0, a_n = 0$  as  $\frac{f(w)}{(w-z_0)^{n+1}}$  is holomorphic making  $\int = 0$

$\Leftarrow$  If  $a_n = 0, \forall n < 0$  then  $f$  is power series centred at  $z_0$ , then  $f$  has a power series centred at  $z_0 \Rightarrow f \in H(z_0)$

Therefore,

Removable sing iff  $a_n = 0 \quad \forall n < 0$

Case II  $f$  has a pole at  $z_0$

$f(z) - \left( \frac{a_{-1}}{z-z_0} + \dots + \frac{a_{-k}}{z-z_0} \right)$  has a remov. sing

Now it is evident.

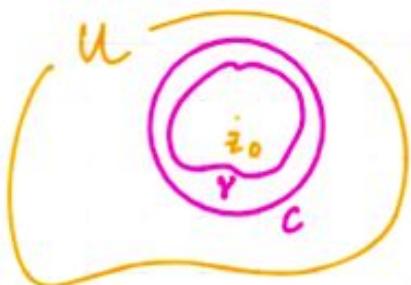

## Analysis

$\gamma$  is closed curve in  $U \setminus \{z_0\}$ ,  $\gamma \tilde{\cup} 0$  and  $\text{Ind}_{\gamma}(z_0) = 1$   
 $\Rightarrow C(z_0; r) \tilde{\cup} \{z_0\} \gamma$

and  $w \mapsto f(w)$ , holo on  $U \setminus \{z_0\}$

$$\Rightarrow \int_{C(z_0; r)} f(w) dw = \int_{\gamma} f(w) dw$$

[homologous version  
of Cauchy's Theorem]

$$f: U \xrightarrow[\text{holo}]{} \mathbb{C}, \quad g: U \xrightarrow[\text{holo}]{} \mathbb{C}$$

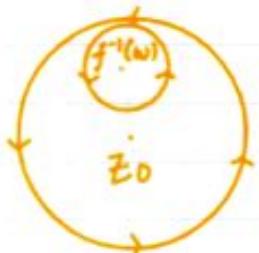

Recall,  $f' \neq 0$  in  $U$ .  $D(z_0; r) \subseteq U \Rightarrow f(D(z_0; r)) \subseteq \mathbb{C}$

Consider,  $w \in f(D(z_0; r))$

$$h(z) = \frac{g(z)f'(z)}{f(z)-w}, \quad z \in D(z_0; r) \setminus \{f^{-1}(w)\}$$

Conclusion:-

$$\text{Res}(h, f^{-1}(w)) = \frac{1}{2\pi i} \int_{C(z_0; r)} \frac{g(z)f'(z)}{f(z)-w} dz$$

- $f' \neq 0$  as  $f$  is 1-1
- $f'(w)$  is zero of  
 $z \mapsto f(z)-w$  (order 1)
- hence a  
pole of order 1

★ Pole of order 1 = simple pole

Proposition :- Suppose  $g \in H(U)$ ,  $f$  has a simple pole at  $z_0$ ,

$$\text{Then } \text{Res}(gf, z_0) = g(z_0) \text{Res}(f, z_0)$$

$$f(z) - \frac{K}{z-z_0} = \varphi(z) \in H(U) \Rightarrow f(z) = \frac{K + \varphi(z)(z-z_0)}{z-z_0} = \frac{\varphi(z)}{z-z_0} : z \neq z_0$$

$$\text{Thus } \varphi(z_0) = \text{Res}(f, z_0)$$

$$\text{Conversely, } f(z) = \frac{\theta(z)}{z-z_0} : \theta \in H(U) : \theta(z_0) \neq 0$$

Then  $f$  has a simple pole at  $z_0$ .

$$\text{Since } f(z) = \frac{\theta(z)}{z-z_0}, \quad \text{Res}(gf, z_0) = g(z_0) \theta(z_0)$$

Hence proved

Continuing :-  $\text{Res}(h, f^{-1}(w)) = g(f^{-1}(w)) \cdot \text{Res}\left(\frac{f'}{f-w}, f^{-1}(w)\right)$   
 as  $\frac{f'}{f-w}$  has simple pole at  $f^{-1}(w)$

$$\Rightarrow \text{Res}(h, f^{-1}(w)) = g(f^{-1}(w)) \cdot 1$$

$$g(f^{-1}(w)) = \frac{1}{2\pi i} \int_{C(z_0; r)} \frac{g(z) f'(z)}{f(z)-w} dz \quad \forall w \in f(D(z_0; r))$$

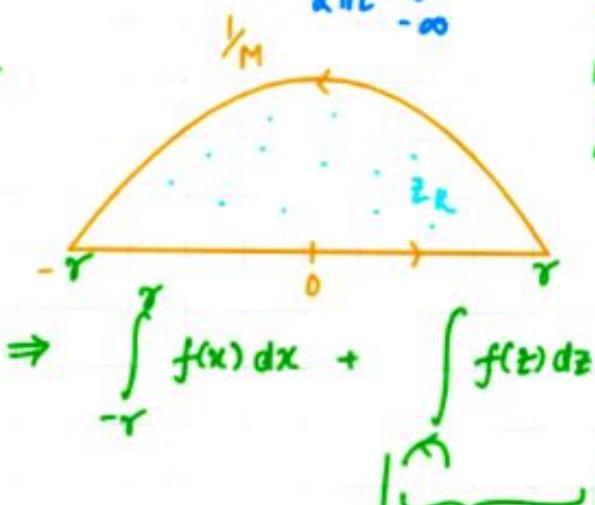

In particular if  $g = \text{Id}$ .

$$\star \star \quad f^{-1}(w) = \frac{1}{2\pi i} \int_{C(z_0; r)} \frac{z + f'(z)}{f(z)-w} dz \quad \forall w \in f(D(z_0; r))$$

Theorem :-  $f$  is holomorphic on  $\mathbb{C}$  except at finitely many poles, none of which are on real line. Also, the ones on the upper half are  $z_1, \dots, z_n$ . Assume further that  $\exists a > 0$  &  $R > 0, M > 0 \ni |f(z)| \leq \frac{M}{|z|^{1+a}} : |z| \geq R$

$$\text{Then, } \frac{1}{2\pi i} \int_{-\infty}^{\infty} f = \sum_{k=1}^n \text{Res}(f, z_k)$$

Proof :-

$M \gg 1$  [suff. large]

From Residue theorem,  $\frac{1}{2\pi i} \int_{y_r} f = \sum \text{Res}(f, z_k) \quad \forall r \gg 1$

$$\Rightarrow \int_{-r}^r f(x) dx + \int_{y_r}^r f(z) dz$$

$| \underbrace{\quad}_{\quad} | \leq \frac{\pi r M}{r^{1+a}} \xrightarrow[r \rightarrow \infty]{} 0$

hence proved.

Using Residue Theory to Calculate Integrals

$$\int_0^\infty f(x) dx = \lim_{R \rightarrow \infty} \int_0^R f(x) dx$$

$$\int_{-\infty}^0, \int_0^\infty$$

If  $\lim_{b \rightarrow \infty} \lim_{a \rightarrow -\infty} \int_a^b f(x) dx$  exists then we say  $\int_{-\infty}^{\infty} f(x) dx$  converges

$\exists \ell \ni \forall \epsilon > 0, \exists R > 0 \ni \text{ whenever } a < -R + b > R$

$$\left| \int_a^b f - \ell \right| < \epsilon$$

Also,  $\lim_{a \rightarrow -\infty} \lim_{b \rightarrow \infty} \int_a^b f \neq \lim_{R \rightarrow \infty} \int_{-R}^R f$  [In general]

Eg.:  $\int_{-R}^R x dx \rightarrow 0$  but  $\int_{-\infty}^{\infty} x dx$  is undefined

If we know Integral is convergent, then,  $\lim_{R \rightarrow \infty} \int_{-R}^R f$  can be used

### Absolute Convergence

If  $\int_{-\infty}^{\infty} |f(x)| dx$  converges, then  $\int_{-\infty}^{\infty} f(x) dx$  converges

Absolute conv.  $\Rightarrow$  conv.

Converse not true eg.:  $\int_{-\infty}^{\infty} \frac{\sin x}{x} dx$

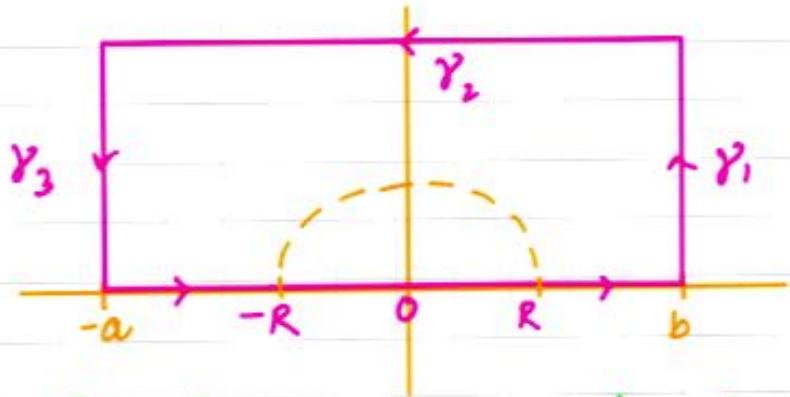

### Fourier Transforms

Assume:

- $f$  is holomorphic in  $C$  except possibly finite points
- None of poles lie on Real line
- Let  $\{z_1, \dots, z_n\}$  be all poles in  $IH$ .
- $f(z) \rightarrow 0$  as  $|z| \rightarrow \infty$  i.e.  $|f(z)| < \epsilon \quad \forall |z| > R_\epsilon$

Then,  $\int_{-\infty}^{\infty} f(x) e^{ixt} dx = 2\pi i \sum_{k=1}^n \operatorname{Res}(f(z) e^{izt}, z_k)$

Proof:- Given  $\epsilon > 0$ , choose  $R > 0 \ni |f(z)| < \epsilon \quad \forall |z| > R$   
 and let  $|z_j| < R \quad \forall j \leq n$ . Also  $\frac{1}{e^{at}} < 1, t > R$

clearly,

$$\int_{\gamma} f(z) e^{izt} dz = \frac{1}{2\pi i} \sum_{k=1}^n \text{Res}(g; z_k)$$

i.e.  $\int_{-a}^b g + \int_{\gamma_1} g + \int_{\gamma_2} g + \int_{\gamma_3} g$ . Now,  $\left| \int_{\gamma_1} g \right| \leq \epsilon \int_{-R}^R e^{-at} dt = \frac{\epsilon}{a} (1 - e^{-ac}) \leq \frac{\epsilon}{a}$

$$\left| \int_{\gamma_2} g \right| \leq \epsilon, \quad \left| \int_{\gamma_3} g \right| < \frac{\epsilon}{a}$$

hence,  $\left| \int_{\gamma} g - \int_{-a}^b g \right| < \epsilon$

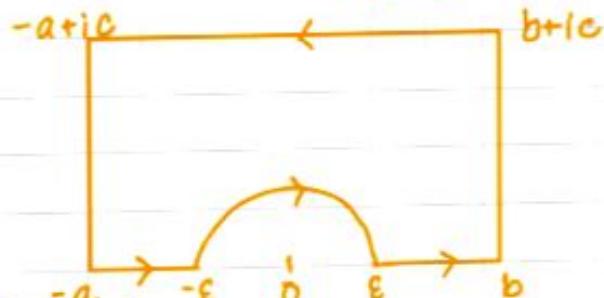

Hence proved ■

Ex :-  $\int_{-\infty}^{\infty} \frac{\sin x}{x} dx$

$$\rightarrow f(z) = \frac{e^{izt}}{z}, \text{ pole at } 0$$

$$0 = \int f(z) dz$$

$$= \int_{-a}^{-\epsilon} f + \int_{\epsilon}^b f + \int_{\gamma_1} + \int_{\gamma_2} + \dots + \int_{\gamma_n} f \Rightarrow \int_{-a}^{-\epsilon} f + \int_{\epsilon}^b f = - \int_{\gamma_1} - \int_{\gamma_n}$$

made arb. small

proposition :- If  $f$  has a simple pole at  $z_0$ , & suppose  $\gamma_k := z_0 + ke^{it}$   
Then

$$\lim_{k \rightarrow 0^+} \int_{\gamma_k} f = i \operatorname{Res}(f, z_0) (\beta - \alpha)$$

last step  
0 < \alpha < \beta < \pi

proof :-  $f(z) = \frac{a}{z} + g(z)$

$$\int_{\gamma_k} f(z) dz = a \int_{\gamma_k} \frac{dz}{z} + \int_{\gamma_k} g(z) dz. \text{ Now } \left| \int_{\gamma_k} g(z) dz \right| \leq M \cdot 2\pi k$$

$\downarrow$   
 $= ia(\beta - \alpha)$ . Hence proved.

continuing |  $\int_{-a}^{-\varepsilon} f + \int_{-\varepsilon}^b \rightarrow \int_a^b f$  as  $a \rightarrow -\infty$   $\varepsilon \rightarrow 0^+$

$\gamma_\varepsilon \rightarrow i\pi$  (Res( $f$ ; 0) = 1)

Taking Im part of  $\int_{-a}^{-\varepsilon} \frac{e^{ix}}{x} + \int_{-\varepsilon}^b \frac{e^{ix}}{x} \rightarrow i\pi$

Trigonometric Integrals =  
 $\int_0^{2\pi} f(\cos\theta, \sin\theta) d\theta .$  | general method :-  
 $\sin\theta \rightarrow (z + \frac{1}{z}) \frac{1}{2i}$  on unit circle

$\int_0^{2\pi} f(\cos\theta, \sin\theta) d\theta = \int_{\gamma_1} f\left(\frac{z+z^{-1}}{2}, \frac{z-z^{-1}}{2i}\right) \frac{1}{iz} dz$

↓ Then Residue Theorem  
 $f(z, s)$  is rational function in 2 variables and makes sense in unit circle (as  $f$  has to be defined)  
 $\Rightarrow \frac{P_1(x, y)}{P_2(x, y)}$  [when replace finite poles  $\Rightarrow f$  has finite poles]

eg:-  $\varphi(x, y) = \frac{1}{x+y}$   
 $y \rightarrow \sin\theta \rightarrow =$

Q:  $\int_0^{2\pi} \sin^{2n}\theta d\theta = \left(\frac{z - \frac{1}{z}}{2i}\right)^{2n} \cdot \frac{1}{iz} = \frac{(-1)^n}{4^n} \cdot \frac{1}{2} \sum_{k=0}^{2n} \binom{2n}{k} z^k \frac{(-1)^{2n-k}}{z^{2n-k}}$

↓  
 hence only pole is at 0

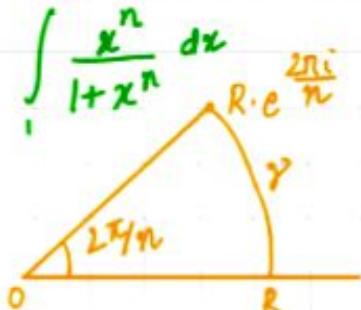

Ans =  $\pi 4^{-n} \binom{2n}{n}$

Q

$$\int_0^\infty \frac{x^{m-1} dx}{1+x^n} : m < n \\ m, n \in \mathbb{N}$$

$$\int_1^\infty \frac{x^{m-1} dx}{1+x^n} \leq \int_1^\infty \frac{x^n dx}{1+x^n} \leq 1 - \underbrace{\frac{1}{1+x^n}}_{\text{converges}} \quad \left. \begin{array}{l} \text{To prove} \\ \int \text{converges} \end{array} \right]$$

$$f(z) = \frac{z^{m-1}}{1+z^n}$$

All poles except  $e^{\frac{i\pi}{n}}$   
lie outside.

$$\int_Y f = \underbrace{\int_0^R \frac{x^{m-1} dx}{1+x^n}}_{=0 \text{ as } R \rightarrow \infty} + \underbrace{\int_{R \sim Re^{i2\pi/n}} f}_{-} - \underbrace{\int_0^R \frac{t^{m-1} p^{2m-1} \cdot p^2 dt}{1+(tp^n)^n}}_{= p^{2m} \int_0^R \frac{x^{m-1} dx}{1+x^n}} : p = e^{i\frac{\pi}{n}}$$

$$= 2\pi i \operatorname{Res}(f, e^{i\frac{\pi}{n}})$$

$$f(z) = \frac{z^{m-1}}{(z-p)(z^{n-1} + \dots + p^{n-1})} \quad \text{and} \quad (1-p^{2m}) \int_0^R \dots = -\frac{1}{n} p^m \cdot 2\pi i$$

$$\Rightarrow \operatorname{Res}(f, p) = \frac{p^{m-1}}{n \cdot p^{n-1}}$$

## Harmonic functions

A real valued function  $u: U \subseteq \mathbb{C} \rightarrow \mathbb{R}$ , is harmonic in  $U$  if  $u \in C^2(U)$  and  $\Delta u = 0$  open

$$\Delta u = 0 \text{ i.e. } \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

e.g.: If  $f \in H(U)$ , then  $\operatorname{Re}(f) + i\operatorname{Im}(f)$  are harmonic

Q if  $u$  is harmonic, Does  $\exists f \in H(U) \ni \operatorname{Re}(f) = u$ .

No, counter :-

$$f: \mathbb{C} \setminus \{0\} \rightarrow \mathbb{R}, \quad f(z) = \log|z|$$

Analysis :-

Let  $f \in H(U)$ ,  $\operatorname{Re}f = u$ .  $f$  is zero free. Suppose  $\exists v: U \rightarrow \mathbb{R}$   
 $\exists g = u + iv$ , is holo. Then, consider  $h(z) = \exp(g(z)) \forall z \in U$

$$|h(z)| = |e^{g(z)}| = e^{\operatorname{Re}(g(z))} = e^u = e^{\log|f|} \Rightarrow \left| \frac{f}{e^g} \right| = 1$$

hence, if  $U$  is connected  $\Rightarrow \exists \alpha \in \mathbb{C} \ni f = \alpha e^g = e^w \cdot e^{\alpha}$

$$\Rightarrow f = e^{(w+g)} \text{ i.e. } f \text{ has analytic logarithm}$$

Corollary:  $U = \text{connected, every harmonic } f^n \text{ has a harmonic conjugate}$   
 $\text{then every } 0\text{-free analytic } f^n \text{ has an analytic log}$   
 $\Leftrightarrow U \text{ is simply connected.}$

Sufficiency

Assume  $U$  is simply connected  $\Rightarrow$  Every harmonic  $f^n$  has a harmonic conjugate

To find

proof:- ( $f \in H(U), \operatorname{Re}(f) = u$ ). Let  $f := u_x - iu_y$ . From CR eqns  
 $f$  is  $C^1$  as  $u$  is  $C^2$ .  $F \in H(U)$

Let  $f$  be primitive of  $f$  (simply connected  $U$ ). Then

$$f = u + iv \text{ (say). } f'(z) = u_z + iv_z = u_x - iu_y \\ = u_x - iu_y$$

hence,  $U = u + c$  (connectedness)

$\Rightarrow f - c$  has real part  $u$  & holo in  $U$
